*Lightweight, command line, workflows for bioinformatics*

Moa aims to assist a bioinformatician to organize, document, share, execute and repeat workflows in a command line environment without losing any of the flexibility of the command line, and, at all times giving the user full access to all aspects of the workflow (see also [Goals](#)).

**\*\*NOTE: both the software and the manual are under development. Things might change.\*\***

## QUICK LINKS

- Source code: <https://github.com/mfiers/Moa>
- Issue tracker: <https://github.com/mfiers/Moa/issues>
- Old issue tracker <<http://moamoa.lighthouseapp.com/projects/73665-moa/overview>>
- Python Package Index: <http://pypi.python.org/pypi/moa/> (note - this is not updated regularly - might not work)
- Source code at [Github](#)
- PDF version of the manual

# TABLE OF CONTENTS:

## 2.1 Goals

Moa has as objective to assist in keeping a bioinformatics project:

- *Organized:*

Moa facilitates project organization in many (smaller and more major) ways, for example by providing a uniform way to capture commands as Moa jobs. Each Moa job is linked to a specific directory, and has all configuration, templates, data, and intermediate data available as files in this directory structure.

- *Documented:*

Moa provides the possibility to add a title, description and changelogs to each job.

- *Reproducible*

By having all templates and configuration copied into a workflow - the workflow does never change (unless the user wants it to), even if templates in the repository change. Moreover, all templates are easy to find & inspect so it is always clear what happened.

- *Reusable & Shareable:*

Moa provides reusable templates. New templates are easy to create, adapt and share. Workflows can be archived and reused with different data.

- *Flexible:*

Moa provides a good number of hooks to insert custom code into a workflow, making that code part of the workflow. This ensures maximum flexibility.

## 2.2 Introduction

These days, generating massive amounts of data is an everyday element of biological research; and almost all projects have a computational biology, or bioinformatics, components. Such embedded work commonly consists of chaining a number of 3<sup>rd</sup> party tools together, often with some data manipulation in between the steps. It is important to have such projects properly organized, particularly when a projects grows bigger.

There are many different ways to organize bioinformatics projects. Many bioinformaticians use the command line or tailor made scripts to organize and automate their work. This approach has obvi-

ous advantages, most importantly flexibility. Potential downsides to scripting are that a project easily becomes disorganized and untraceable unless measures are taken.

*Moa* aims to assist in organizing, automating and maintaining a command line bioinformatics project without loss of flexibility.

### 2.2.1 Example

The best way to understand how *Moa* can help you to achieve this is by an example. A *Moa* workflow consists of separate *Moa* jobs. A workflow is typically organised as a directory tree, where the structure of the tree reflects the structure of the project. So, Starting a *Moa* project starts with outlining a directory structure to contain the workflow:

```
$ mkdir test.project && cd test.project
$ mkdir 00.proteins

( copy or link some protein sequences into 00.proteins )

$ mkdir 10.blast
$ cd 10.blast
```

An important feature of *Moa* is that each separate analysis step is contained within a separate directory. Two *Moa* jobs never share a directory. This forces a *Moa* user to break a workflow down to atomic parts, which is typically beneficial to the organization and coherence of a workflow. The order of steps is easily ordered by prefixing directory names with a number. Note that these prefixes are not enforced by *Moa*; any alphabetical organization would work as well. Once a directory is created, a *Moa* job can be created:

```
$ moa new blast -t "demo run"
```

All interaction with *Moa* is done through a single command: *moa*. It is, at all times, possible to get help on the use of the *moa* command by invoking *moa -help*. The command above creates a *BLAST* job titled “demo run” in the current directory. All *Moa* related files are stored in a (hidden) sub-directory names *.moa* (have a look!). A *Moa* job consists, amongst others, of a configuration file and a number of template files. All template files are copied into the *.moa* directory. This ensures that a workflow remains the same over time, even if the templates are updated (*moa refresh* would update a template to the latest version).

Another topic in which *Moa* tries to help is by embedding (some) documentation. In the above command line the *-t* parameter sets a mandatory project title (a job won’t execute without a title).

Obviously, telling a *Moa* job to do a *BLAST* analysis is not enough, some extra information will need to be given:

```
$ moa set db=/data/blast/db/nr
```

A few things could be noted here. Important is that you do not use spaces around the = sign. If you want to define a parameter with spaces, use quotes (*key="value with spaces"*), and be aware of bash interpretation. A safe way of entering complex parameters is by running *moa set db* and *Moa* will query you the value.

Another point is that *Moa* does not give you a response. You can check the current job configuration using *moa show*, which would at this moment result in something resembling:

```
db      L /data/blast/db/nr
input   E (undefined)
jobid   L blast
title   L demo run
```

Note the variable *db* and *title*, which were set earlier. If you run *show -a*, more parameters will be revealed, amongst which is *program*. We will now set two more variables:

```
$ moa set program=blastp
$ moa set input=../00.proteins/*.fasta
```

The last statement defines the input files to blast. Once all is set you can actually run the BLAST analysis with:

```
$ moa run
```

Now Moa performs the BLAST analysis on the input files. The output can be found in the *out* sub-directory. As an extra, the Moa *blast* template generates a *blast\_report* file with simple one line report for the best five hits of each query sequence. If you, for example, would like to check for the presence of dicer genes in your query set, you could *grep* this file:

```
$ grep -i dicer blast_report
```

Command line operation of data files can be very powerful, and this would be a typical operation for a command line bioinformatician. Moa lets you capture this and thus make it a part of the pipeline. Try:

```
$ moa set postcommand
```

and, at the prompt enter:

```
postcommand:
> grep -i dicer blast_report > dicer.out
```

If you now rerun *moa*, the BLAST job will not be repeated, but the *postcommand* will be executed and a *dicer.out* file will be generated. (note, there is also a *precommand*)

## 2.3 Installation

### 2.3.1 Prerequisites

Moa is developed and tested on [Ubuntu](#) and [RHEL](#) and is expected to operate without much problems on all modern Linux distributions. Moa has the following prerequisites (and a large number more for all templates). Version numbers are an indication, not strict prerequisites. Other, even older, versions might work.

- [Python](#) (2.6 or 2.7). Moa will not work with versions earlier, or with 3.0 and up
- [Git](#) (1.6). Necessary either to download the Moa software from github, or, to make use of the integrated version control.
- A number of support scripts & templates depend on [Biopython](#). Consider installing it before starting to use Moa.
- *Python-dev*: the Python development package. A few prerequisites installed by *easy\_install* try to compile C libraries, and need this. Although all of them have backup, python only, alternatives; from a performance perspective it is probably smart to have this installed:

```
sudo apt-get install python-dev
```

- *python-yaml*: On ubuntu, this installs a fast YAML parser - using *easy\_install* or *pip* might install a slower, python only, version:

```
sudo apt-get install python-yaml
```

### 2.3.2 Python prerequisites

These prereqs can be installed manually or with *easy\_install* or *pip*:

- *pyyaml* (unless already installed)
- *Jinja2*
- *Ruffus*
- *gitpython*
- **‘*unittest2* <http://pypi.python.org/pypi/unittest2>’**
- **‘*lockfile* <http://pypi.python.org/pypi/lockfile>’**

Not part of the list of prerequisites are the following libraries, which you’ll only need if you are planning to run the web interface:

- *ElementTree*
- *Markdown*

### 2.3.3 Bioinformatics tools

Each of the wrapped tools requires the tools to be present. Usually, Moa expects all tools to be present & executable on the system PATH. The standard Moa distribution comes with wrappers for:

- Blast
- BWA
- Bowtie
- Soap

and many more

### 2.3.4 Installing git (from github)

Moa is hosted on, and can be installed from, [github](#):

```
cd ~
git clone git://github.com/mfiers/Moa.git moa
```

Note - there is also a copy of moa in the python package index - this one is almost certainly outdated, and is currently not supported.

### 2.3.5 Configuration

Configuration of Moa is simple, and can be done by sourcing the *moainit* script:

```
. ~/moa/bin/moainit
```

(Note the dot!, alternatively use: `source ~/moa/bin/moainit`)

It is probably a good idea to add this line to your `~/ .bashrc` for future sessions.

Moa should now work, try *moa -help*.

If your default python version is NOT *python2.6* or *python2.7* there are a few options that you can pursue:

- change the hashbang of the *moa* script
- define an alias in your `~/ .bashrc`: `alias moa='python2.6 moa'`
- create a symlink to python2.6 in your `~/bin` directory and make sure that that is first in your path.

### 2.3.6 Installing the web interface

Note - this is highly experimental - you will probably need to fiddle with the configuration files to get it working. Start with installing apache2.

Then - assuming that: \* Your Moa work directory is under `/home/moa/work` \* Your Moa is installed in `/opt/moa` Create a file in `/etc/apache2/conf.d/moa.conf` with the following approximate contents:

```
Alias /moa/data /home/moa/work
<Directory /home/moa/work>
    Options +Indexes +FollowSymLinks
    Order allow,deny
    Allow from all

    SetEnv MOADATAROOT /home/moa/work
    SetEnv MOAWEBROOT /moa/data

    IndexOptions FoldersFirst SuppressRules HTMLTable IconHeight=24 SuppressHTMLPreamble

    HeaderName /moa/cgi/indexHeader.cgi
    ReadmeName /moa/html/indexFooter.html
</Directory>

ScriptAlias /moa/cgi/ /opt/moa/www/cgi/
<Directory /opt/moa/www/cgi/>
    AddType text/html .cgi
    Order allow,deny
    Allow from all
    SetEnv MOABASE /opt/moa
</Directory>

Alias /moa/html/ /opt/moa/www/html/
<Directory /opt/moa/www/html>
    Order allow,deny
    Allow from all
    Options +Indexes
</Directory>
```

You might want to check the `#!/` of `/opt/moa/www/cgi/indexHeader.cgi` depending on your system configuration. Restart apache and it should work

## 2.4 Three core templates

Moa comes with a list of templates (see *templates*). The three most important, flexible templates of these that allow you to embed custom code (called *process*) in your project are:

*simple*:

Simply executes *process* as a bash one-liner

*map*:

Takes a set of in- and output files and executes the custom commands for each in- and output file (using the [Jinja2](#) template language).

*reduce*:

Takes a set of input files and a single output file and executes the custom commands with all input file, generating the output files.

Since *simple*, *map* and *reduce* have proven to be quite central to how Moa operates they come with their own shortcut commands (*moa simple*, *moa map* and *moa reduce*). These command query the user directly for the parameters instead of having to define this manually.

For example, a *simple* job:

```
$ mkdir simple_test && cd simple_test
$ moa simple -t 'Generate some files'
process:
> for x in `seq 1 5`; do touch test.$x; done
$ moa run
$ ls
test.1  test.2  test.3  test.4  test.5
```

Note that you can make your *process* as complicated as you like. Alternatively, you can write a script that you call from *process*.

A map job would work like this:

```
$ mkdir ../map_test && cd ../map_test
$ moa map -t 'Map some files'
process:
> echo {{ input }} ; echo {{ input }} > {{ output }}
input:
> ../simple_test/test.*
output:
> ./out.*
$ moa run
../simple_test/test.3
../simple_test/test.1
../simple_test/test.5
../simple_test/test.2
../simple_test/test.
Moa: Success executing "run" (<1 sec)
$ ls
out.1  out.2  out.3  out.4  out.5
```

```
$ cat out.1
../simple_test/test.1
```

Moa tracks which input file generates which outputfile. So, if you would like to repeat one of the jobs - you'll need to delete the output file & rerun *moa*:

```
$ rm out.3
$ moa run
../simple_test/test.3
Moa: Success executing "run" (<1 sec)
```

And a *reduce* example:

```
$ mkdir ../reduce_test && cd ../reduce_test
$ moa reduce -t 'Reduce some files'
process:
> echo {{ " ".join(input) }} >> {{ output }}
input:
> ../map_test/out.*
output:
> ./reduce_out
$ moa run
Moa: Success executing "run" (<1 sec)
$ ls
reduce_out
$ cat reduce_out
../map_test/out.1 ../map_test/out.3 ../map_test/out.4 ../map_test/out.5 ../map_test/out.6
```

## 2.5 Synchronizing jobs

It is quite often usefull to repeat a jobs on a number of different input files. For simple operations, one liners, this ca be accomplished using *moa map*. More complex operations, or those requiring a template other than *map* can be replicated using job synchronization. Assume you have a set of fastq libraries, each in it's own directory:

```
./fq/set1/set1_1.fq
./fq/set1/set1_2.fq
./fq/set2/set2_1.fq
./fq/set2/set2_2.fq
./fq/set3/set3_1.fq
./fq/set3/set3_2.fq
```

And you want to run a bowtie alignment for each separately. The approach to take is to create a directory containing all alignments:

```
mkdir bowtie
cd bowtie
```

and, in that directory, create one job running bowtie, in a directory named **exactly** as the input directories:

```
mkdir set1
cd set1
moa new bowtie -t 'run bowtie for {{_}}'
```

Note the magic variable `{{_}}`. This variable is replaced by the name of the current directory. So when running *moa show*, the title would show up as “run bowtie for set1”. This magic variable can be used

in all variables, and we'll use it here to set this job up in such a way that it can be reused for the other datasets:

```
set moa fq_forward_input='../..fq/{_{_}}/*_1.fq'
# .. configure the remaining variables
```

Now - we replicate this directory in the following manner. We'll move one directory up, to the *bowtie* directory, and create a *sync* job:

```
cd ..
moa new sync -t 'run bowtie for all fq datasets'
moa set source=../fq/
```

The sync template keeps directories synchronized, based on the *source* directory. If you now run *moa run* in the *bowtie* directory, two more directories will be created: *set2* and *set3*, each containing a verbatim copy of the original bowtie job created.

If, at a certain moment you obtain more fastq datasets:

```
../fq/set4/set4_1.fq
../fq/set4/set4_2.fq
```

you can repeat *moa run* in the *.bowtie* sync directory, and a new directory will be created. Note that the *sync* template will not remove directories. Also if you want to update the configuration of the synchronized bowtie jobs, you only need to change the configuration in one directory, run *moa run* again in the *.bowtie* directory and the configuration is synchronized across all jobs.

**NOTE: both the software and the manual are under development. Expect things to change.**

## 2.6 How to write a template

A MOA template is made up of a *.moa* file and a *.jinja2* (or *.mk*) file.

The *.moa* file mainly contains input-output file sets and parameter options used for the bash command(s). Some of these options have default values which the user can change while constructing the job.

The *.jinja2* file includes information to structure the command(s). It is written in *jinja*, which is a templating language for python and is simple to write and easy to understand.

These files are used by the backend, currently *ruffus*, that manages file set and parameter dependencies to make pipelines and render commands to the bash prompt. Initially, *GNU make* was the backend used. It is very powerful but some of its limitations and its complexity led to including *ruffus* as an option for the backend as well.

The easiest way to write a moa template is to edit an existing template to suit your requirements. This involves understanding the parts of an existing template.

The *bwa\_aln* template is used as an example below. Just as a background, the *bwa aln* command takes a FASTQ file as input and aligns it to a reference genome that was previously indexed. The output is a *.sai* file with the alignments.

The *bwa\_aln.moa* file has some main components:

- *Backend*

```
backend: ruff
```

This is ‘ruff’ which means that `ruffus` is used in the python script at a lower level to read the template .moa and .jinja2 file, and render the corresponding commands to the bash prompt.

- *Commands*

```
commands:
  run:
    mode: map
    help: run bwa aln
  clean:
    mode: simple
    help: Remove all job data, not the Moa job itself, note that this must be imple
```

This indicates the function names that you will later define. In the example above, there are 2 commands- run and clean, so moa run or moa clean on the command prompt in the job directory would execute these functions.

- *Filesets*

```
filesets:
  input:
    category: input
    extension: fq
    help: Fastq input files
    glob: '*'
    optional: false
    type: set
  output:
    category: output
    dir: .
    extension: sai
    glob: '{{ input_glob }}'
    source: input
    type: map
```

Like the name, each filesets refer to a set of files in a single directory. The bwa\_aln template shows 2 filesets: input and output.

- *Category*: is essentially used to separate input from output.
- *Extension*: refers to the type of file(s) required or generated.
- *Glob*: searches for files with a specified pattern. Moa, by default (glob= \*) automatically processes all files of the specified input extension in the directory specified. By specifying a glob, Moa will only process those files whose name pattern matches what is in the glob.
- *Type*: refers to the data type of the fileset or parameter.

A fileset can either be of `set` or `map` type. The type `set` refers to a simple set of files in a directory. The type `map` refers to a set of files that are linked to what their `source` value is. In the above code, the output fileset is mapped to the input fileset.

- *Dir*: the directory of the output fileset is ‘.’, which means that the output files will be placed in the current working directory.

- *Parameter category order*

```
parameter_category_order:
- ''
- input
- system
- advanced
```

- *Parameters*

```
mismatch_penalty:
  category: ''
  default: 3
  help: mismatch penalty
  optional: true
  type: integer
```

They are the variables/options that specify a command.

- *Category*:
- *Default*: is the value that is used by default if not changed by the user.
- *Optional*: specifies if it is necessary for the user to fill in a value for the variable. If `optional` is false, the user has to indicate a value for the parameter in order to execute the job.
- *Type*: specifies the data type of the variable eg. integer, string, boolean.

- *Moa\_id*

```
moa_id: bwa_aln
```

is supposed to be the same as the filename. Ideally something descriptive (eg. `bwa_aln`). This is used to later link to the other template file.

The other template file is “`bwa_aln.jinja2`” which is written in [jinja](#), a templating language for python. *Note that the `jinja2` file name is the same as the `moa` file name.*

Important features of the `bwa_aln.jinja2` file are:

- The three hash’s (###) specify the start of a function and are followed by the function name. In our `bwa_aln` example, we have defined 2 funtions: `run` and `clean`.

```
### run
```

- This definition is followed by a set of commands which you would want to be executed when you type `moa run` or `moa_clean` in the `bwa_aln` job directory. The commands in our example file look the same as what you would put in the command prompt but the values of the parameters are bought from the `.moa` file and hence it’s value is replaced by the parameter name.

```
bwa aln {{db}} \
-n {{edit_dist_missing_prob}} \
. \
. \
. \
{{ input }} \
-f {{ output }}
```

- It is also possible to add if-else statements or other computing blocks in accordance with the design language.

```
{% if color_space %} -c {% endif %}
```

## 2.7 Command reference

### 2.7.1 moa !

Create a ‘simple’ job from the last command issued. Set the *process* parameter to the last issued command. If a moa job exists in the current directory, then the *process* parameter is set without questions. (even if the Moa job in question does not use the *process* parameter). If no moa job exists, a *simple* job is created first. *Note:* This works only when using *bash* and if *moainit* is sourced properly. *moainit* defines a bash function *\_moa\_prompt* that is called every time a command is issued (using *\$PROMPT\_COMMAND*). The *\_moa\_prompt* function takes the last command from the bash history and stores it in *~/config/moa/last.command*. Additionally, the *\_moa\_prompt* function stores all commands issued in a Moa directory in *.moa/local\_bash\_history*.

**optional arguments:**

<b>-h, --help</b>	show this help message and exit
<b>-r, --recursive</b>	Run this job recursively
<b>-v, --verbose</b>	Show debugging output
<b>--profile</b>	Run the profiler
<b>-f, --force</b>	Force this action
<b>-t TITLE, --title TITLE</b>	A title for this job

---

### 2.7.2 moa archive

Archive a job, or tree with jobs for later reuse. This command stores only those files that are necessary for execution of this job, that is: templates & configuration. In & output files, and any other file are ignored. An exception to this are all files that start with ‘moa. If the *name* is omitted, it is derived from the *jobid* parameter. It is possible to run this command recursively with the *-r* parameter - in which case all (moa job containing) subdirectories are included in the archive.

**positional arguments:** name archive name

**optional arguments:**

<b>-h, --help</b>	show this help message and exit
<b>-r, --recursive</b>	Run this job recursively
<b>-v, --verbose</b>	Show debugging output
<b>--profile</b>	Run the profiler
<b>-f, --force</b>	Force this action
<b>-s, --sync</b>	Alternative approach to deal with sync type jobs - only include _ref directories
<b>-t, --template</b>	Store this archive as a template

### 2.7.3 moa blog

Add an entry to the blog job (Blog.md) Allows a user to maintain a blog for this job (in Blog.md). Use as follows:: \$ moa blog Enter your blog message (ctrl-d on an empty line to finish) ... enter your message here .. [ctrl-d] Note: the ctrl-d needs to be given on an empty line. The text is appended to moa.description. In the web interface this is converted to **Markdown\_**. .. \_Markdown: <http://daringfireball.net/projects/markdown/> markdown.

**optional arguments:**

<b>-h, --help</b>	show this help message and exit
<b>-r, --recursive</b>	Run this job recursively
<b>-v, --verbose</b>	Show debugging output
<b>--profile</b>	Run the profiler

---

### 2.7.4 moa change

Add entry to CHANGELOG.md This function allows the user to add an entry to CHANGELOG.md (including a timestamp). Use it as follows:: \$ moa change Enter your changelog message (ctrl-d on an empty line to finish) ... enter your message here .. [ctrl-d] Note: the ctrl-d needs to be given on an empty line. The text is appended to moa.description. In the web interface this is converted to **Markdown\_**. .. \_Markdown: <http://daringfireball.net/projects/markdown/> markdown. Note the same can be achieved by specifying the -m parameter (before the command - for example: *moa -m 'intelligent remark' set ...*

**optional arguments:**

<b>-h, --help</b>	show this help message and exit
<b>-r, --recursive</b>	Run this job recursively
<b>-v, --verbose</b>	Show debugging output
<b>--profile</b>	Run the profiler

---

### 2.7.5 moa cp

Copy a moa job, or a tree with jobs (with -r). moa cp copies only those files defining a job: the template files and the job configuration. Additionally, all files in the moa directory that start with *moa*. (for example *moa.description* are copied as well. Data and log files are not copied!. If used in conjunction with the -r (recursive) flag the complete tree is copied.

**positional arguments:** from copy from this path to copy to this path

**optional arguments:**

<b>-h, --help</b>	show this help message and exit
<b>-r, --recursive</b>	Run this job recursively

---

<b>-v, --verbose</b>	Show debugging output
<b>--profile</b>	Run the profiler
<b>-o, --overwrite</b>	if the target dir exists - overwrite (insteadof copying into that dir)

---

### 2.7.6 moa err

Show the stderr of the most recently executed moa job

**optional arguments:**

<b>-h, --help</b>	show this help message and exit
<b>-r, --recursive</b>	Run this job recursively
<b>-v, --verbose</b>	Show debugging output
<b>--profile</b>	Run the profiler

---

### 2.7.7 moa files

Show in and output files for this job Display a list of all files discovered (for input & prerequisite type filesets) and inferred from these for map type filesets.

**optional arguments:**

<b>-h, --help</b>	show this help message and exit
<b>-r, --recursive</b>	Run this job recursively
<b>-v, --verbose</b>	Show debugging output
<b>--profile</b>	Run the profiler

---

### 2.7.8 moa kill

Kill a running job. This command checks if a job is running. If so - it tries to kill it by sending SIGKILL (-9) to the job.

**optional arguments:**

<b>-h, --help</b>	show this help message and exit
<b>-r, --recursive</b>	Run this job recursively
<b>-v, --verbose</b>	Show debugging output
<b>--profile</b>	Run the profiler

---

### 2.7.9 moa list

Lists all known templates Print a list of all templates known to this moa installation. This includes locally installed templates as well.

**optional arguments:**

<b>-h, --help</b>	show this help message and exit
<b>-r, --recursive</b>	Run this job recursively
<b>-v, --verbose</b>	Show debugging output
<b>--profile</b>	Run the profiler
<b>-d</b>	Print a short template description

---

### 2.7.10 moa lock

Lock a job - prevent execution

**optional arguments:**

<b>-h, --help</b>	show this help message and exit
<b>-r, --recursive</b>	Run this job recursively
<b>-v, --verbose</b>	Show debugging output
<b>--profile</b>	Run the profiler

---

### 2.7.11 moa log

Show activity log Shows a log of moa commands executed. Only commands with an impact on the pipeline are logged, such as *moa run* & *moa set*.

**optional arguments:**

<b>-h, --help</b>	show this help message and exit
<b>-r, --recursive</b>	Run this job recursively
<b>-v, --verbose</b>	Show debugging output
<b>--profile</b>	Run the profiler

---

### 2.7.12 moa map

create an adhoc moa 'map' job Moa will query the user for process, input & output files. An example session

**optional arguments:**

<b>-h, --help</b>	show this help message and exit
-------------------	---------------------------------

---

<b>-r, --recursive</b>	Run this job recursively
<b>-v, --verbose</b>	Show debugging output
<b>--profile</b>	Run the profiler
<b>-f, --force</b>	Force this action
<b>-t TITLE, --title TITLE</b>	A title for this job

---

### 2.7.13 moa mv

Move, rename or renumber a moa job.

**positional arguments:** from copy from this path to copy to this path

**optional arguments:**

<b>-h, --help</b>	show this help message and exit
<b>-r, --recursive</b>	Run this job recursively
<b>-v, --verbose</b>	Show debugging output
<b>--profile</b>	Run the profiler

---

### 2.7.14 moa new

Create a new job. This command creates a new job with the specified template in the current directory. If the directory already contains a job it needs to be forced using '-f'. It is possible to define arguments for the job on the commandline using KEY=VALUE after the template. Note: do not use spaces around the '=' sign. Use quotes if you need spaces in variables (KEY='two values')

**positional arguments:** template name of the template to use for this moa job parameter arguments for this job, specifyas KEY=VALUE without

spaces

**optional arguments:**

<b>-h, --help</b>	show this help message and exit
<b>-r, --recursive</b>	Run this job recursively
<b>-v, --verbose</b>	Show debugging output
<b>--profile</b>	Run the profiler
<b>-f, --force</b>	Force this action
<b>-d DIRECTORY, --directory DIRECTORY</b>	directory to create the job in
<b>-t TITLE, --title TITLE</b>	mandatory job title

---

### 2.7.15 moa out

Show the stdout of the most recently executed moa job

**optional arguments:**

<b>-h, --help</b>	show this help message and exit
<b>-r, --recursive</b>	Run this job recursively
<b>-v, --verbose</b>	Show debugging output
<b>--profile</b>	Run the profiler

---

### 2.7.16 moa pause

Pause a running job

**optional arguments:**

<b>-h, --help</b>	show this help message and exit
<b>-r, --recursive</b>	Run this job recursively
<b>-v, --verbose</b>	Show debugging output
<b>--profile</b>	Run the profiler

---

### 2.7.17 moa postcommand

Execute 'postcommand'

**optional arguments:**

<b>-h, --help</b>	show this help message and exit
<b>-r, --recursive</b>	Run this job recursively
<b>-v, --verbose</b>	Show debugging output
<b>--profile</b>	Run the profiler

---

### 2.7.18 moa precommand

Execute 'precommand'

**optional arguments:**

<b>-h, --help</b>	show this help message and exit
<b>-r, --recursive</b>	Run this job recursively
<b>-v, --verbose</b>	Show debugging output
<b>--profile</b>	Run the profiler

---

### 2.7.19 moa readme

Edit the README.md file for this job You could, obviously, also edit the file yourself - this is a mere shortcut to try to stimulate you in maintaining one

**optional arguments:**

<b>-h, --help</b>	show this help message and exit
<b>-r, --recursive</b>	Run this job recursively
<b>-v, --verbose</b>	Show debugging output
<b>--profile</b>	Run the profiler

---

### 2.7.20 moa refresh

Refresh the template Reload the template from the original repository.

**optional arguments:**

<b>-h, --help</b>	show this help message and exit
<b>-r, --recursive</b>	Run this job recursively
<b>-v, --verbose</b>	Show debugging output
<b>--profile</b>	Run the profiler

---

### 2.7.21 moa resume

Resume a running job

**optional arguments:**

<b>-h, --help</b>	show this help message and exit
<b>-r, --recursive</b>	Run this job recursively
<b>-v, --verbose</b>	Show debugging output
<b>--profile</b>	Run the profiler

---

### 2.7.22 moa set

Set one or more variables This command can be used in two ways. In its first form both parameter key and value are defined on the command line: *moa set KEY=VALUE*. Note that the command line will be processed by bash, which can either create complications or prove very useful. Take care to escape variables that you do not want to be expandend and use single quotes where necessary. For example, to include a space in a variable: *moa set KEY='VALUE WITH SPACES'*. Alternative use of the set command is by just specifying the key: 'moa set PARAMETER\_NAME', in which case Moa will prompt the user enter a value - circumventing problems with bash interpretation.

**positional arguments:** parameter arguments for this job, specify as KEY=VALUE without spaces

**optional arguments:**

<b>-h, --help</b>	show this help message and exit
<b>-r, --recursive</b>	Run this job recursively
<b>-v, --verbose</b>	Show debugging output
<b>--profile</b>	Run the profiler
<b>-f, --force</b>	Force this action

---

### 2.7.23 moa show

Show all parameters known to this job. Parameters in **bold** are specifically configured for this job (as opposed to those parameters that are set to their default value). Parameters in red are not configured, but need to be for the template to operate. Parameters in blue are not configured either, but are optional.

**optional arguments:**

<b>-h, --help</b>	show this help message and exit
<b>-r, --recursive</b>	Run this job recursively
<b>-v, --verbose</b>	Show debugging output
<b>--profile</b>	Run the profiler
<b>-u</b>	show unrendered values (when using inline parameters)
<b>-R</b>	show recursively defined parameters not specified by the local template
<b>-p</b>	show private parameters
<b>-a</b>	show all parameters

---

### 2.7.24 moa simple

Create a 'simple' adhoc job. Simple meaning that no in or output files are tracked. Moa will query you for a command to execute (the *process* parameter).

**optional arguments:**

<b>-h, --help</b>	show this help message and exit
<b>-r, --recursive</b>	Run this job recursively
<b>-v, --verbose</b>	Show debugging output
<b>--profile</b>	Run the profiler
<b>-f, --force</b>	Force this action
<b>-t TITLE, --title TITLE</b>	A title for this job

---

### 2.7.25 moa status

Show job status Print a short status of the job, including configuration

**optional arguments:**

<b>-h, --help</b>	show this help message and exit
<b>-r, --recursive</b>	Run this job recursively
<b>-v, --verbose</b>	Show debugging output
<b>--profile</b>	Run the profiler
<b>-u</b>	show unrendered values (when using inline parameters)
<b>-R</b>	show recursively defined parameters not specified by the local template
<b>-p</b>	show private parameters
<b>-a</b>	show all parameters

---

### 2.7.26 moa test

Test the job parameters

**optional arguments:**

<b>-h, --help</b>	show this help message and exit
<b>-r, --recursive</b>	Run this job recursively
<b>-v, --verbose</b>	Show debugging output
<b>--profile</b>	Run the profiler

---

### 2.7.27 moa tree

Show a directory tree and job status

**positional arguments:** filter show only directories that match this filter

**optional arguments:**

<b>-h, --help</b>	show this help message and exit
<b>-r, --recursive</b>	Run this job recursively
<b>-v, --verbose</b>	Show debugging output
<b>--profile</b>	Run the profiler
<b>-a, --all</b>	

---

### 2.7.28 moa unlock

Unlock a job - allow execution

**optional arguments:**

<b>-h, --help</b>	show this help message and exit
<b>-r, --recursive</b>	Run this job recursively
<b>-v, --verbose</b>	Show debugging output
<b>--profile</b>	Run the profiler

---

### 2.7.29 moa unset

Remove a parameter from the configuration Remove a configured parameter from this job. In the parameter was defined by the job template, it reverts back to the default value. If it was an ad-hoc parameter, it is lost from the configuration.

**positional arguments:** parameter parameter to unset

**optional arguments:**

<b>-h, --help</b>	show this help message and exit
<b>-r, --recursive</b>	Run this job recursively
<b>-v, --verbose</b>	Show debugging output
<b>--profile</b>	Run the profiler

---

### 2.7.30 moa version

print moa version number

**optional arguments:**

<b>-h, --help</b>	show this help message and exit
<b>-r, --recursive</b>	Run this job recursively
<b>-v, --verbose</b>	Show debugging output
<b>--profile</b>	Run the profiler

---

### 2.7.31 msp

moa set process

Usage:

msp

this is an alias for the often used:

```
moa set process
```

## 2.8 Templates

Contents:

### 2.8.1 abyss\_pe

Run Abysspe

#### Commands

**clean** Remove all job data

**run** Execute abysspe in paired-end mode

#### Filesets

**fq\_forward** fastq input files directory - forward

**fq\_reverse** fastq input files directory - reverse

```
type: map
source: fq_forward
category: input
optional: True
pattern: */*_2.fq
```

**output** soap denovo output file

```
type: single
category: output
optional: True
pattern: {}
```

#### Parameters

**joinpairs** number of pairs needed to consider joining two contigs

*type: integer*  
*default: 10*  
*optional: True*

**kmer** kmer size

*type: integer*  
*default: 31*  
*optional: True*

**threads** no threads to use

*type: integer*  
*default: 3*  
*optional: True*

## miscellaneous

**Backend** ruff

**Author** Mark Fiers

**Creation date** Mon, 21 Nov 2011 12:47:16

**Modification date** Mon, 21 Nov 2011 12:47:22

## 2.8.2 abyss\_se

Run Abysspe

## Commands

**clean** Remove all job data

**run** Execute abyss se

## Filesets

**input** fastq input files directory

**output** soap denovo output file

*type: single*  
*category: output*  
*optional: True*

*pattern: {}*

## Parameters

**kmer** kmer size

*type: integer*  
*default: 31*  
*optional: True*

**threads** no threads to use

*type: integer*  
*default: 3*  
*optional: True*

## miscellaneous

**Backend** ruff

**Author** Mark Fiers

**Creation date** Mon, 21 Nov 2011 12:47:16

**Modification date** Mon, 21 Nov 2011 12:47:22

## 2.8.3 adhoc

### Execute an ad hoc analysis

The *adhoc* template assists in running one-liners - possibly on a set of input files

## Commands

**clean** Remove all job data, not the Moa job itself, note that this must be implemented by the template.

**run** *no help defined*

## Filesets

**input** Input files for adhoc

### Parameters

#### **mode**

operation mode: *seq*, sequential: process the input files one by one; *par*, parallel: process the input files in parallel (use with *-j*); *all*: process all input files at once (use *\$^* in *adhoc\_process*) and *simple*: Ignore input files, just execute *adhoc\_process* once.

*type: set*

*default: simple*

*optional: True*

**name\_sed** A sed expression which can be used to derive the output file name for each input file (excluding the path). The sed expression is executed for each input file name, and the result is available as *\$t* in the *\$(adhoc\_process)* statement. Make sure that you use single quotes when specifying this on the command line

*type: string*

*default: s/a/a/*

*optional: True*

**output\_dir** Output subdirectory

*type: directory*

*default: .*

*optional: True*

**process** Command to execute for each input file. The path to the input file is available as *\$<* and the output file as *\$t*. (it is not mandatory to use both parameters, for example “cat *\$<* > output” would concatenate all files into one big file)

*type: string*

*default: echo “needs a sensible command”*

*optional: True*

**touch** use touch files to track if input files have changed.

*type: set*

*default: T*

*optional: True*

### 2.8.4 archroot

#### Helper script for a root archive

Helper script for the root of an archive template

#### Commands

**run** *no help defined*

#### Parameters

**moa\_archive\_parameters** space separated list of parameters to set for this template

*type: string*

*default: {}*

*optional: False*

## miscellaneous

**Backend** ruff

**Author** Mark Fiers

**Creation date** Tue, 17 Apr 2012 10:21:31

**Modification date** Tue, 17 Apr 2012 10:21:25

### 2.8.5 bamextract

#### bamextract

Extract a region from a BAM file

#### Commands

**clean** Remove all job data, not the Moa job itself, note that this must be implemented by the template.

**run** Extract a region from a BAM file

## Filesets

**bam** BAM input

*type: single*  
*category: input*  
*optional: False*  
*pattern: {}*

**regions** List with regions to extract (id seqid start stop)

*type: single*  
*category: input*  
*optional: True*  
*pattern: {}*

## Parameters

**flank** flanking region to extract

*type: integer*  
*default: 100*  
*optional: {}*

## miscellaneous

## 2.8.6 bartab

**Bartab**

BARTAB - a tool to process sff files

## Commands

**clean** Remove all job data, not the Moa job itself, note that this must be implemented by the template.

**run**

## Parameters

**extra\_parameters** extra parameters to feed bartab

*type: string*  
*default: ""*  
*optional: True*

**forward\_primer** remove forward primer

*type: string*  
*default: ""*  
*optional: True*

**in** input file for bartab

*type: file*  
*default: ""*  
*optional: False*

**map** A file mapping barcodes to metadata

*type: file*  
*default: ""*  
*optional: True*

**min\_length** minimum acceptable sequence length

*type: integer*  
*default: 50*  
*optional: True*

**out** base output name

*type: integer*  
*default: bartab*  
*optional: True*

**qin** Quality scores for the input fasta file

*type: file*  
*default: ""*  
*optional: True*

**reverse\_primer** remove reverse primer

*type: string*  
*default: ""*  
*optional: True*

**trim** Trim barcode

*type: set*  
*default: T*  
*optional: True*

## miscellaneous

## 2.8.7 bdbb

### Bidirectional best BLAST hit

Discover the bidirectional best blast hit between two sets of sequences

### Commands

**clean** Remove all job data, not the Moa job itself, note that this must be implemented by the template.

**run** generate a list of bidirectional best blast hits between two databases of sequences

### Filesets

**input\_a** First multi fasta input set

*type: single*  
*category: input*  
*optional: False*  
*pattern: \*/\*.fasta*

**input\_b** Second multi fasta input set

*type: single*  
*category: input*  
*optional: False*  
*pattern: \*/\*.fasta*

**output** List of bidirectional best blasts hits

*type: map*  
*source: input\_a*  
*category: output*  
*optional: True*  
*pattern: \*/\*.list*

## Parameters

**eval** e value cutoff

*type: float*  
*default: 1e-10*  
*optional: True*

**extract** Extract the identified sequences from the input fasta files

*type: boolean*  
*default: False*  
*optional: True*

**nothreads** Threads to run blast with with

*type: integer*  
*default: 4*  
*optional: True*

**protein** Is this a protein set

*type: boolean*  
*default: False*  
*optional: True*

**tblastx** If this is a nucleotide set, use tblastx?? (otherwise use blastn)

*type: boolean*  
*default: F*  
*optional: True*

## miscellaneous

**Backend** ruff

**Modification date** unknown

## 2.8.8 bfast\_aln

Generate bam format alignments using bfast

## Commands

**clean** Remove all job data, not the Moa job itself

**run** run bfast match, localalign, postprocess commands

## Filesets

**fa\_input** fasta input file

**fq\_input** fastq input files

**output\_aln**

*type: map*  
*source: fq\_input*  
*category: output*  
*optional: {}*  
*pattern: /\*.aln*

**output\_bam**

*type: map*

*source: fq\_input*  
*category: output*  
*optional: {}*  
*pattern: ./\*.bam*

## Parameters

**algorithm\_colour\_space** true -> colour space, false -> NT space

*type: boolean*  
*default: False*  
*optional: True*

**avg\_mism\_qual** Specifies the average mismatch quality

*type: integer*  
*default: 10*  
*optional: True*

**extra\_params\_localalign** Any extra parameters for the localalign command

*type: string*  
*default: ""*  
*optional: True*

**extra\_params\_match** Any extra parameters for the match command

*type: string*  
*default: ""*  
*optional: True*

**extra\_params\_postprocess** Any extra parameters for the postprocess command

*type: string*  
*default: ""*  
*optional: True*

**min\_mapping\_qual** Specifies to remove low mapping quality alignments

*type: integer*  
*default: -2147483648*  
*optional: True*

**min\_norm\_score** Specifies to remove low (alignment) scoring alignments

*type: integer*  
*default: -2147483648*  
*optional: True*

**output\_format** 0 - BAF, 1 - SAM

*type: integer*  
*default: 1*  
*optional: True*

**paired\_opp\_strands** Specifies that paired reads are on opposite strands

*type: boolean*  
*default: False*  
*optional: True*

**pairing\_std\_dev** Specifies the pairing distance standard deviation to examine when recuing

*type: float*  
*default: 2.0*  
*optional: True*

**print\_params** print program parameters

*type: boolean*  
*default: False*  
*optional: True*

**thread\_num** Specifies the number of threads to use

*type: integer*

*default: 1*  
*optional: True*

**timing\_information** specifies output timing information

*type: boolean*  
*default: True*  
*optional: True*

**ungapped\_aln** Do ungapped local alignment

*type: boolean*  
*default: False*  
*optional: True*

**ungapped\_pairing\_rescue** Specifies that ungapped pairing rescue should be performed

*type: boolean*  
*default: False*  
*optional: True*

**unpaired\_reads** True value specifies that pairing should not be performed

*type: boolean*  
*default: False*  
*optional: True*

**usage\_summary** Display usage summary (help)

*type: boolean*  
*default: False*  
*optional: True*

**which\_strand** 0 - consider both strands, 1 - forwards strand only, 2 - reverse strand only

*type: integer*  
*default: 0*

*optional: True*

## 2.8.9 bfast\_db

Generate db index files for aligning reads with bfast

## Commands

**clean** Remove all job data, not the Moa job itself

**run** run bfast fasta2brg and index commands

## Filesets

**fa\_input** fasta input file

## Parameters

**algorithm\_colour\_space** true -> colour space, false -> NT space

*type: boolean*  
*default: False*  
*optional: True*

**depth** The depth of the splitting(d). The index will be split into  $4^d$  parts.

*type: integer*  
*default: 0*  
*optional: True*

**extra\_params** Any extra parameters

*type: string*  
*default: ""*

*optional: True*

**hash\_width** The hash width for the index (recommended from manual = 14)

*type: integer*

*default: {}*

*optional: False*

**index\_num** Specifies this is the ith index you are creating

*type: integer*

*default: 1*

*optional: True*

**mask** The mask or spaced seed to use.

*type: string*

*default: {}*

*optional: False*

**print\_params** print program parameters

*type: boolean*

*default: False*

*optional: True*

**thread\_num** Specifies the number of threads to use

*type: integer*

*default: 1*

*optional: True*

**timing\_information** specifies output timing information

*type: boolean*

*default: True*

*optional: True*

**usage\_summary** Display usage summary (help)

*type: boolean*  
*default: False*  
*optional: True*

## 2.8.10 blast

### Basic Local Alignment Tool

Wraps BLAST [[Alt90]], probably the most popular similarity search tool in bioinformatics.

## Commands

**clean** Remove all job data, not the Moa job itself, note that this must be implemented by the template.

**report** Generate a text BLAST report.

**run** Running BLAST takes an input directory, determines what sequences are present and executes BLAST on each of these. Moa BLAST is configured to create XML output (as opposed to the standard text based output) in the out directory. The output XML is subsequently converted to GFF3 by the custom blast2gff script (using BioPython). Additionally, a simple text report is created.

## Filesets

**db** Blast database

*type: single*  
*category: prerequisite*  
*optional: False*  
*pattern: \*/\**

**input** Directory with the input files for BLAST, in Fasta format

**outgff** GFF output files

*type: map*  
*source: input*  
*category: output*  
*optional: True*  
*pattern: gff/\*.gff*

**output** XML blast output files

*type: map*  
*source: input*  
*category: output*  
*optional: True*  
*pattern: out/\*.out*

## Parameters

**eval** e value cutoff

*type: float*  
*default: 1e-10*  
*optional: True*

**gff\_blasthit** (T,\*\*F\*\*) - export an extra blasthit feature to the created gff, grouping all hsp (match) features.

*type: set*  
*default: F*  
*optional: True*

**gff\_source** source field to use in the gff

*type: string*  
*default: BLAST*  
*optional: True*

**nohits** number of hits to report

*type: integer*  
*default: 50*

*optional: True*

**nothreads** threads to run blast with (note the overlap with the Make -j parameter)

*type: integer*

*default: 2*

*optional: True*

**program** blast program to use (default: blastn)

*type: set*

*default: blastn*

*optional: True*

## miscellaneous

## 2.8.11 blastdb

### Commands

**clean** Remove all job data, not the Moa job itself, note that this must be implemented by the template.

**run** Takes either a set of fasta files or a single multi-fasta input file and creates a BLAST database.

### Filesets

**dbname**

*type: map*

*source: input*

*category: output*

*optional: {}*

*pattern: ./db*

**input** The file with all input FASTA sequences for the blastdb.

*type: single*

*category: input*  
*optional: False*  
*pattern: \*/\*.fasta*

## Parameters

**protein** Protein database? (T)rue or not (F)alse (default: F)

*type: set*  
*default: F*  
*optional: True*

## miscellaneous

**Backend** ruff

**Author** Mark Fiers

**Creation date** Wed Nov 10 07:56:48 2010

## 2.8.12 blat

### Blat

Run BLAT on an set of input files (query) vs a database.

## Commands

**clean** Remove all job data, not the Moa job itself, note that this must be implemented by the template.

**run** *no help defined*

## Parameters

**db** type of the database (dna, prot or dnax)

*type: set*  
*default: “*  
*optional: False*

**db\_id\_list** a sorted list of db ids and descriptions, enhances the report generated

*type: file*

*default: ""*  
*optional: True*

**db\_type** type of the database (dna, prot or dnax)

*type: set*  
*default: dna*  
*optional: True*

**eval** evaluate cutoff to select the reported hits on (defaults to 1e-15)

*type: float*  
*default: 1e-10*  
*optional: True*

**gff\_source** Source field for the generated GFF files

*type: string*  
*default: ""*  
*optional: False*

**input\_dir** source field in the generated gff

*type: directory*  
*default: ""*  
*optional: False*

**input\_extension** extension of the input files

*type: string*  
*default: fasta*  
*optional: True*

**input\_file** input query file. If this variable is not defined, the combination of `blat_input_dir` and `blat_input_extension` is used to find a list of input files

*type: file*

*default: ""*  
*optional: False*

**query\_type** type of the query (dna, rna, prot, dnax or rnax)

*type: set*  
*default: dna*  
*optional: True*

## 2.8.13 bowtie

### Bowtie

Run BOWTIE on an set of input files (query) vs a database index.

### Commands

**clean** Remove all job data, not the Moa job itself, note that this must be implemented by the template

**run** *no help defined*

### Filesets

**input** Fasta/fastq input files for bowtie

**output** Output files

*type: map*  
*source: input*  
*category: output*  
*optional: {}*  
*pattern: /\*.bam*

## Parameters

**db** The (basename of the) bowtie database to use.

*type: string*  
*default: {}*  
*optional: False*

**extra\_params** extra parameters to feed bowtie

*type: string*  
*default: ""*  
*optional: True*

**input\_format** Format of the input files

*type: set*  
*default: fastq*  
*optional: True*

## miscellaneous

**Backend** ruff

**Author** Mark Fiers

**Creation date** Wed Nov 10 07:56:48 2010

**Modification date** Wed Nov 10 07:56:48 2010

### 2.8.14 bowtie\_pe

Run BOWTIE on an set of input files (query) vs a database index.

## Commands

**clean** Remove all job data, not the Moa job itself

**finish** finish up

**report** Create a report on the results

**run** Execute soapdenovo in paired-end mode

## Filesets

**db** The (basename of the) bowtie database to use.

*type: single*  
*category: prerequisite*  
*optional: False*  
*pattern: ../20.bowtiedb/db*

**fq\_forward\_input** Fastq input files - forward

**fq\_reverse\_input** Fastq input files - reverse

*type: map*  
*source: fq\_forward\_input*  
*category: input*  
*optional: True*  
*pattern: \*/\*\_2.fq*

**output** Bam output file

*type: map*  
*source: fq\_forward\_input*  
*category: output*  
*optional: {}*  
*pattern: \*/\*.bam*

## Parameters

**extra\_params** extra parameters to feed to bowtie

*type: string*  
*default: ""*  
*optional: True*

**input\_format** Format of the input files

*type: set*  
*default: fastq*  
*optional: True*

**lots\_of\_data** Keep unmapped reads, unsorted BAM - takes up a lot of space!

*type: boolean*

*default: False*

*optional: True*

**max\_insertsize** Maximum allowed insertsize

*type: integer*

*default: 250*

*optional: True*

**min\_insertsize** Minimum allowed insertsize

*type: integer*

*default: 1*

*optional: True*

**orientation** orientation of the reads, allowed values are fr, rf, ff

*type: {}*

*default: fr*

*optional: True*

### miscellaneous

**Backend** ruff

**Author** Mark Fiers

**Creation date** Wed Nov 10 07:56:48 2010

**Modification date** Wed Nov 10 07:56:48 2010

### 2.8.15 bowtie\_se

Run BOWTIE on an set of input files (query) vs a database index.

### Commands

**clean** Remove all job data, not the Moa job itself, note that this must be implemented by the template

**run** *no help defined*

## Filesets

**fq\_input** fastq input files directory

**output** Bam output file

*type: map*  
*source: fq\_input*  
*category: output*  
*optional: {}*  
*pattern: /\*.bam*

## Parameters

**ebwt\_base** The (basename of the) bowtie database to use.

*type: string*  
*default: {}*  
*optional: False*

**extra\_params** extra parameters to feed to bowtie

*type: string*  
*default: ""*  
*optional: True*

**input\_format** Format of the input files

*type: set*  
*default: fastq*  
*optional: True*

**output\_format** Format of the output file

*type: set*  
*default: bam*  
*optional: True*

### 2.8.16 bowtiedb

#### Bowtie index builder

Builds a bowtie index from a reference sequence

#### Commands

**clean** Remove all job data, not the Moa job itself, note that this must be implemented by the template.

**run** Create the bowtie database

#### Filesets

**input** Input fasta file for the bowtie database

**output** database name to create

*type: single*

*category: output*

*optional: {}*

*pattern: db*

#### Parameters

**extra\_params** any option parameters

*type: string*

*default: ""*

*optional: True*

## miscellaneous

**Backend** ruff

**Author** Mark Fiers

**Creation date** Wed Nov 10 07:56:48 2010

**Modification date** Wed Dec 09 07:56:48 2010

### 2.8.17 bwa\_aln

Use BWA to align a set of fastq reads against a db

#### Commands

**clean** Remove all job data, not the Moa job itself, note that this must be implemented by the template.

**run** run bwa aln

#### Filesets

**input** Fastq input files

**output**

*type: map*  
*source: input*  
*category: output*  
*optional: {}*  
*pattern: ./\*.sai*

#### Parameters

**best\_hits\_stop** stop searching when there are >INT equally best hits

*type: integer*  
*default: {}*  
*optional: True*

**color\_space** input sequences are in the color space

*type: boolean*  
*default: False*  
*optional: True*

**db** bwa database to align against

*type: string*  
*default: {}*  
*optional: False*

**edit\_dist\_missing\_prob** max

*type: float*  
*default: {}*  
*optional: True*

**gap\_ext\_max**

*type: integer*  
*default: {}*  
*optional: True*

**gap\_ext\_penalty** gap extension penalty

*type: integer*  
*default: {}*  
*optional: True*

**gap\_open\_penalty** gap open penalty

*type: integer*  
*default: {}*  
*optional: True*

**gap\_opens\_max** maximum number or fraction of gap opens

*type: integer*  
*default: {}*  
*optional: True*

**log\_gap\_penalty\_del** log-scaled gap penalty for long deletions

*type: boolean*  
*default: {}*  
*optional: True*

**max\_ext\_long\_del** maximum occurrences for extending a long deletion

*type: integer*

*default: {}*  
*optional: True*

**max\_queue\_entry** maximum entries in the queue

*type: integer*  
*default: {}*  
*optional: True*

**mismatch\_penalty** mismatch penalty

*type: integer*  
*default: {}*  
*optional: True*

**no\_indel\_from\_ends** do not put an indel within INT bp towards the ends

*type: integer*  
*default: {}*  
*optional: True*

**non\_iterative** non-iterative mode search for all n-difference hits (slow)

*type: boolean*  
*default: False*  
*optional: True*

**quality\_step** quality threshold for read trimming down to 35bp

*type: integer*  
*default: {}*  
*optional: True*

**seed\_len** Seed length

*type: integer*  
*default: {}*

*optional: True*

**seed\_max\_diff** Maximum differences in the seed

*type: integer*

*default: {}*

*optional: True*

**thread\_num** number of threads

*type: integer*

*default: {}*

*optional: True*

## **miscellaneous**

**Backend** ruff

**Modification date** unknown

## **2.8.18 bwa\_index**

### **Bwa index builder**

Builds a bwa index from a reference sequence

## **Commands**

**clean** Remove all job data

**run** Create the index

## **Filesets**

**input** Input fasta file for the bowtie database

*type: single*

*category: input*

*optional: False*

*pattern: \*/\*.fasta*

## Parameters

**algorithm** Algorithm for constructing BWT index. Available options are ‘is’ and ‘bwtsv’

*type: string*  
*default: is*  
*optional: True*

**color\_space** input sequences are in the color space

*type: boolean*  
*default: False*  
*optional: True*

**prefix** Name of the bwa index to create

*type: string*  
*default: db*  
*optional: True*

## miscellaneous

### 2.8.19 bwa\_sampe

Generate alignments in SAM format given paired end reads

## Commands

**clean** Remove all job data, not the Moa job itself

**run** run bwa sampe

## Filesets

**fq\_forward\_input** fastq input files directory - forward

**fq\_reverse\_input** fastq input files directory - reverse

*type: map*  
*source: fq\_forward\_input*  
*category: input*  
*optional: True*  
*pattern: \*/\*\_2.fq*

#### **output\_bam**

*type: map*  
*source: fq\_forward\_input*  
*category: output*  
*optional: {}*  
*pattern: \*/\*.bam*

**sai\_forward\_input** sai input files - forward

*type: map*  
*source: fq\_forward\_input*  
*category: input*  
*optional: False*  
*pattern: \*/\*\_1.sai*

**sai\_reverse\_input** sai input files - reverse files

*type: map*  
*source: sai\_forward\_input*  
*category: input*  
*optional: True*  
*pattern: \*/\*\_2.sai*

## **Parameters**

**db** bwa database to align against

*type: string*  
*default: {}*  
*optional: False*

**disable\_insert\_size** disable insert size estimate (force -s)

*type: boolean*

*default: False*

*optional: True*

**disable\_SW** disable Smith-Waterman for the unmapped mate

*type: boolean*

*default: False*

*optional: True*

**max\_aln\_out** maximum hits to output for paired reads

*type: integer*

*default: 3*

*optional: True*

**max\_insert\_size** maximum insert size

*type: integer*

*default: 500*

*optional: True*

**max\_occ\_read** maximum occurrences for one end

*type: integer*

*default: {}*

*optional: True*

**max\_out\_discordant\_pairs** maximum hits to output for discordant pairs

*type: integer*

*default: {}*

*optional: True*

**preload\_index** preload index into memory (for base-space reads only)

*type: boolean*

*default: False*

*optional: True*

**prior\_chimeric\_rate** prior of chimeric rate (lower bound)

*type: integer*

*default: {}*

*optional: True*

**Modification date** unknown

## 2.8.20 bwa\_samse

Generate alignments in SAM format given single end reads, using both ‘bwa samse’.

## Commands

**clean** Remove all job data, not the Moa job itself

**run** run bwa samse

## Filesets

**fq\_input** fastq input file

**output\_bam** output bam file

*type: map*

*source: fq\_input*

*category: output*

*optional: {}*

*pattern: /\*.bam*

**sai\_input** sai input directory - filenames must correspond to the fastq input files

*type: map*

*source: fq\_input*

*category: input*

*optional: False*  
*pattern: \*/\*.sai*

## Parameters

**db** bwa database to align against

*type: string*  
*default: ''*  
*optional: False*

**max\_aln\_out** Maximum number of alignments to output in the XA tag for reads paired properly

*type: integer*  
*default: 3*  
*optional: True*

## miscellaneous

**Backend** ruff

**Author** Yogini Idnani, Mark Fiers

**Creation date** Wed Nov 25 17:06:48 2010

## 2.8.21 cdsmatrix

### CdsMatrix

Predicts (prokaryotic) using glimmer3.

## Commands

**clean** Remove all job data, not the Moa job itself, note that this must be implemented by the template.

**run** Generate a matrix of CDS's

## Filesets

**input** Directory with the cds files for Glimmer3

**output** Output blast files

*type: map*

*source: input*  
*category: output*  
*optional: True*  
*pattern: ./\*.out*

**reference** reference multi fasta file

*type: single*  
*category: prerequisite*  
*optional: {}*  
*pattern: \*/\*.fasta*

**table** table files

*type: map*  
*source: input*  
*category: output*  
*optional: True*  
*pattern: ./\*.tab*

## Parameters

**cutoff** score cutoff value - disregards hits below this score

*type: {}*  
*default: 100*  
*optional: True*

## miscellaneous

**Backend** ruff

**Author** Mark Fiers

**Creation date** Wed Nov 10 07:56:48 2010

**Modification date** Thu, 21 Jul 2011 20:31:10 +1200

### 2.8.22 cleanFasta

**clean Fasta**

Convert files to unix format and convert all characters that are not an A,C,G,T or N to N.

## Commands

**clean** Remove all job data, not the Moa job itself, note that this must be implemented by the template.

**run** Cleanup of a FASTA file (in place!)

## Parameters

**cf\_input\_dir** Directory with the sequences to run cleanfasta on

*type: directory*

*default: ""*

*optional: False*

**cf\_input\_extension** input file extension

*type: string*

*default: fasta*

*optional: True*

**sed\_command**

*type: string*

*default: />/!s/[^ACGTNacgtn]/N/g*

*optional: True*

## 2.8.23 clustalgroup

**clustalw**

Run clustalw on two sets of sequences

## Commands

**clean** Remove all job data, not the Moa job itself, note that this must be implemented by the template.

**run** run clustalw

## Parameters

**cwg\_input\_dir** This set of sequences to run clustalw on

*type: directory*

*default: ""*

*optional: False*

**cwg\_input\_extension** Input file extension

*type: string*

*default: fasta*

*optional: True*

## miscellaneous

## 2.8.24 clustalpair

**clustalw**

Run clustalw on two sets of sequences

## Commands

**clean** Remove all job data, not the Moa job itself, note that this must be implemented by the template.

**run** run clustalw

## Parameters

**input\_dir\_a** This set is compared to the sequences in input\_dir\_b. only a forward comparison is made (a against b, not the other way round )

*type: directory*

*default: ""*

*optional: False*

**input\_dir\_b** The set to compare against

*type: directory*

*default: ""*

*optional: False*

**input\_extension** Extension of the input files

*type: string*

*default: fasta*

*optional: True*

## miscellaneous

## 2.8.25 clustalw

### clustalw

Run clustalw on two sets of sequences

## Commands

**clean** Remove all job data, not the Moa job itself, note that this must be implemented by the template.

**run** run clustalw

## Parameters

**input\_dir\_a** This set is compared to the sequences in input\_dir\_b.

*type: directory*

*default: ""*

*optional: False*

**input\_dir\_b** The set to compare against. Only a forward comparison is made (a against b, not the other way round)

*type: directory*

*default: “*

*optional: False*

**input\_extension** Extension of the input files

*type: string*

*default: fasta*

*optional: True*

## miscellaneous

**Backend** gnumake

**Author** Mark Fiers

**Creation date** Wed Nov 10 07:56:48 2010

**Modification date** Wed Nov 10 07:56:48 2010

## 2.8.26 concatenate

### Concatenate

Concatenate a set of fasta files into one.

### Commands

**clean** Remove all job data, not the Moa job itself, note that this must be implemented by the template.

**run** *no help defined*

### Parameters

**input\_dir** Directory with the input data

*type: directory*

*default: “*

*optional: False*

**input\_extension** Extension of the input files

*type: string*

*default: fasta*

*optional: True*

**name** name of the file, the outputfile will become ./name.fasta

*type: string*

*default: ""*

*optional: False*

## miscellaneous

**Backend** gnumake

**Author** Mark Fiers

## 2.8.27 dottup

### EMBOSS Dottup

Use dottup (from EMBOSS) to compare two sets of sequences

## Commands

**clean** Remove all job data, not the Moa job itself, note that this must be implemented by the template.

**run** Run dottup

## Parameters

**input\_dir\_a** This set is compared to the sequences in input\_dir\_b.

*type: directory*

*default: ""*

*optional: False*

**input\_dir\_b** The set to compare against

*type: directory*

*default: ""*

*optional: True*

**input\_extension** Extension of the dottup input files

*type: string*  
*default: fasta*  
*optional: True*

**wordsize** Wordsize used to discover similarities between sequences

*type: integer*  
*default: 8*  
*optional: True*

## miscellaneous

**Backend** gnumake

### 2.8.28 empty

**empty**

Do nothing...

## Commands

### Parameters

## miscellaneous

**Backend** ruff

**Author** Mark Fiers

**Creation date** Mon Apr 04 16:02:58 2011

**Modification date** Mon Apr 04 16:03:18 2011

### 2.8.29 fasta2gff

#### GFF from FASTA

Derive GFF from a FASTA file, usually to accompany the Sequence for upload to a generic genome browser database.

## Commands

**clean** Remove all job data, not the Moa job itself, note that this must be implemented by the template.

**run** *no help defined*

## Parameters

**f2g\_gffsource** Source to be used in the gff

*type: string*

*default: ""*

*optional: False*

**f2g\_input\_dir** Directory with the input fasta files

*type: directory*

*default: ""*

*optional: False*

**f2g\_input\_extension** glob pattern of the fasta files (default: \*.fasta)

*type: string*

*default: fasta*

*optional: True*

**f2g\_options** options to be passed to the fasta2gff script

*type: string*

*default: ""*

*optional: True*

**f2g\_output\_dir** Directory with the output gff

*type: directory*

*default: ./gff*

*optional: True*

## miscellaneous

**Backend** gnumake

**Author** Mark Fiers

**Creation date** Wed Nov 10 07:56:48 2010

## 2.8.30 fastainfo

**gather information on a set of fasta files**

gather info on a set of input files

### Commands

**finish** create a report

**run** generate info on each of the input sequences

### Filesets

**input** “fastainfo” input files

**output** “fastainfo” raw output files

*type: map*  
*source: input*  
*category: output*  
*optional: True*  
*pattern: stats/\*.out*

**stats** “fastainfo” collect stat files

*type: map*  
*source: input*  
*category: output*  
*optional: True*  
*pattern: stats/\*.stat*

### Parameters

## miscellaneous

**Backend** ruff

**Author** Mark Fiers

**Creation date** Mon, 11 Jul 2011 15:15:20

**Modification date** Mon, 11 Jul 2011 15:15:12

### 2.8.31 fastqc

#### Run FastQC for fastq QC

Run FastQC on a set a fastq files - quality assessment

#### Commands

**finish** Run Fastqc

**finish** delegates execution to: **report**

**report** Generate a simple fastqc report

**run** *no help defined*

#### Filesets

**input** fastqc input files'

**touch** touch files - track if a file has been processed - do not touch this unless you know what you're doing.

*type: map*  
*source: input*  
*category: output*  
*optional: True*  
*pattern: /\*.touch*

#### Parameters

**output\_dir** output directory for the fastQC report

*type: dir*  
*default: .*  
*optional: True*

#### miscellaneous

**Backend** ruff

**Author** Mark Fiers

**Creation date** Thu, 28 Apr 2011 09:27:17 +1200

**Modification date** Thu, 28 Apr 2011 14:19:04 +1200

## 2.8.32 fastx\_clipper

run fastx\_clipper

### Commands

**clean** Remove all job data, not the Moa job itself

**run** run fastx\_clipper

### Filesets

**input** fastq input files directory

**output**

*type: map*

*source: input*

*category: output*

*optional: {}*

*pattern: /\*.fq*

### Parameters

**adaptor** ADAPTER string. default is CCTTAAGG (dummy adapter).

*type: string*

*default: CCTTAAGG*

*optional: True*

**adaptor\_and\_bases** Keep the adapter and N bases after it.

*type: integer*

*default: 0*

*optional: True*

**compress\_output** Compress output with GZIP.

*type: boolean*

*default: False*

*optional: True*

**debug\_output** DEBUG output.

*type: boolean*  
*default: False*  
*optional: True*

**help** help screen

*type: boolean*  
*default: False*  
*optional: True*

**keep\_unknown\_nuc\_seq** keep sequences with unknown (N) nucleotides. default is to discard such sequences.

*type: boolean*  
*default: False*  
*optional: True*

**out\_adaptor\_only\_seq** Report Adapter-Only sequences.

*type: boolean*  
*default: False*  
*optional: True*

**rm\_clipped\_seq** Discard clipped sequences (i.e. - keep only sequences which did not contained the adapter).

*type: boolean*  
*default: False*  
*optional: True*

**rm\_non\_clipped\_seq** Discard non-clipped sequences (i.e. - keep only sequences which contained the adapter).

*type: boolean*

*default: False*  
*optional: True*

**rm\_short\_seq** discard sequences shorter than N nucleotides. default is 5.

*type: integer*  
*default: 5*  
*optional: True*

**verbose** Verbose - report number of sequences. If [-o] is specified, report will be printed to STDOUT. If [-o] is not specified (and output goes to STDOUT), report will be printed to STDERR.

*type: boolean*  
*default: False*  
*optional: True*

### 2.8.33 fastx\_qual\_stats

run fastx\_quality\_stats, fastq\_quality\_boxplot\_graph.sh and  
fastx\_nucleotide\_distribution\_graph.sh

## Commands

**clean** Remove all job data, not the Moa job itself

**run** run fastx\_quality\_stats, fastq\_quality\_boxplot\_graph.sh and fastx\_nucleotide\_distribution\_graph.sh

## Filesets

**boxplot\_output**

*type: map*  
*source: input*  
*category: output*  
*optional: {}*

*pattern: ./\*.png*

**input** fastq input files directory

**nuc\_distr\_output**

*type: map*

*source: input*

*category: output*

*optional: {}*

*pattern: ./\*.png*

**qual\_output**

*type: map*

*source: input*

*category: output*

*optional: {}*

*pattern: ./\*.txt*

## Parameters

**gen\_postScript\_file** Generate PostScript (.PS) file. Default is PNG image.

*type: boolean*

*default: False*

*optional: True*

**graph\_title** Title - will be plotted on the graph.

*type: string*

*default: {{ input\_glob }}*

*optional: True*

**help** help screen

*type: boolean*

*default: False*

*optional: True*

**new\_out\_format** New output format (with more information per nucleotide/cycle)

*type: boolean*

*default: False*

*optional: True*

## miscellaneous

**Backend** ruff

**Author** Mark Fiers, Yogini Idnani

**Creation date** Wed Dec 03 17:06:48 2010

**Modification date** unknown

### 2.8.34 filterwgs\_pair

Execute a “map22” ad-hoc analysis - two input files, two output files

Filter raw WGS data

## Commands

**run** Filter WGS data

## Filesets

**input1** forward input fastq

**input2** reverse input fastq

*type: map*  
*source: input1*  
*category: input*  
*optional: False*  
*pattern: \*/\**

**output1** forward output fastq

*type: map*  
*source: input1*  
*category: output*  
*optional: True*  
*pattern: ./\**

**output2** reverse output fastq

*type: map*

*source: input1*  
*category: output*  
*optional: True*  
*pattern: ./\**

## Parameters

**adapters** Fasta file with the adapter sequences to trim

*type: file*  
*default: {}*  
*optional: False*

**minlen** Minimum remaining sequence length

*type: int*  
*default: 50*  
*optional: True*

**qual** quality threshold causing trimming

*type: int*  
*default: 13*  
*optional: True*

**title**

*type: {}*  
*default: Filter paired fastq files using fastq-mcf*  
*optional: {}*

## miscellaneous

## 2.8.35 gather

### gather files

gather a set of files and create hardlinks to. Hardlinks have as advantage that updates are noticed via the timestamp. Hence, make recognizes them.

### Commands

**clean** Remove all job data, not the Moa job itself, note that this must be implemented by the template.

**run** gather files

### Parameters

**g\_input\_dir** list of directories with the input files

*type: directory*

*default: ""*

*optional: False*

**g\_input\_pattern** glob pattern to download

*type: string*

*default: \**

*optional: True*

**g\_limit** limit the number of files gathered (with the most recent files first, defaults to 1mln)

*type: integer*

*default: 1000000*

*optional: True*

**g\_name\_sed** SED expression to be executed on each file name - allows you to change file names

*type: string*

*default: s/a/a/*

*optional: True*

**g\_output\_dir** Output subdirectory, defaults to .

*type: directory*

*default: .*

*optional: True*

**g\_parallel** allow parallel execution (T) or not (F). If for example concatenating to one single file, you should not have multiple threads.

*type: set*

*default: F*

*optional: True*

**g\_powerclean** Do brute force cleaning (T/F). Remove all files, except moa.mk & Makefile when calling make clean. Defaults to F.

*type: set*

*default: F*

*optional: True*

**g\_process** Command to process the files. If undefined, hardlink the files.

*type: string*

*default: ln -f \$\$< \$(g\_target)*

*optional: True*

## 2.8.36 genemarks

**geneMarkS**

predict genes using geneMarkS

## Commands

**clean** Remove all job data, not the Moa job itself, note that this must be implemented by the template.

**run** *no help defined*

## Filesets

**input** Directory with the input files for Genemarks

## Parameters

**gff\_source** source field to use in the gff. Defaults to “geneMarkS”

*type: string*  
*default: genemarkS*  
*optional: True*

**matrix** the matrix to use

*type: file*  
*default: “*  
*optional: True*

## 2.8.37 getorf

**Getorf**

Predicts open reading frames using the EMBOSS `[[emboss]]` getorf tool.

## Commands

**clean** Remove all job data, not the Moa job itself, note that this must be implemented by the template.

**run** *no help defined*

## Filesets

### **gff**

*type: map*  
*source: input*  
*category: output*  
*optional: {}*  
*pattern: ./gff/\*.gff*

**input** Input files for getorf

### **output**

*type: map*  
*source: input*  
*category: output*  
*optional: {}*  
*pattern: ./out/\*.out*

## Parameters

**circular** Is the sequence linear?

*type: set*  
*default: N*  
*optional: True*

**find** What to output? 0: Translation between stop codons, 1: Translation between start & stop codon, 2: Nucleotide sequence between stop codons; 3: Nucleotide sequence between start and stop codons.  
Default: 3

*type: set*  
*default: 3*  
*optional: True*

**gff\_source** source field to use in the gff.

*type: string*  
*default: getorf*  
*optional: True*

**maxsize** maximal nucleotide size of the predicted ORF.

*type: integer*  
*default: 1000000*  
*optional: True*

**minsize** minimal nucleotide size of the predicted ORF.

*type: integer*  
*default: 30*  
*optional: True*

**table** Genetic code to use: 0 Standard; 1 Standard with alternative initiation codons; 2 Vertebrate Mitochondrial; 3 Yeast Mitochondrial; 4 Mold, Protozoan, Coelenterate Mitochondrial and Mycoplasma/Spiroplasma; 5 Invertebrate Mitochondrial; 6 Ciliate Macronuclear and Dasycladacean; 9 Echinoderm Mitochondrial; 10 Euplotid Nuclear; 11 Bacterial; 12 Alternative Yeast Nuclear; 13 Ascidian Mitochondrial; 14 Flatworm Mitochondrial; 15 Blepharisma Macronuclear; 16 Chlorophycean Mitochondrial; 21 Trematode Mitochondrial; 22 Scenedesmus obliquus; 23 Thraustochytrium Mitochondrial.

*type: set*  
*default: 11*  
*optional: True*

## 2.8.38 glimmer3

### Glimmer3

Predicts (prokaryotic) using glimmer3.

## Commands

**clean** Remove all job data, not the Moa job itself, note that this must be implemented by the template.

**run** Glimmer3 is a open reading frame discovery program from the EMBOSS `[[emboss]]` package. It takes a set of input sequences and predicts all open reading frames. Additionally, this template converts the default output (predicted protein sequences) to GFF3.

## Filesets

**cds** CDS output files from glimmer3

*type: map*  
*source: input*  
*category: output*  
*optional: True*  
*pattern: cds/\*.fasta*

**gff** GFF output files from glimmer3

*type: map*  
*source: input*  
*category: output*  
*optional: True*  
*pattern: gff/\*.gff*

**input** Directory with the input files for Glimmer3

**output** Raw output files from glimmer3

*type: map*  
*source: input*  
*category: output*  
*optional: True*  
*pattern: out/\*.g3*

**pep** peptide output files from glimmer3

*type: map*  
*source: input*  
*category: output*  
*optional: True*  
*pattern: pep/\*.fasta*

## Parameters

**gene\_len** Minimum gene length (glimmer3 -g/--gene\_len)

*type: integer*  
*default: 110*  
*optional: True*

**gff\_source** source field to use in the gff. Defaults to “glimmer3”

*type: string*  
*default: glimmer3*  
*optional: True*

**max\_overlap** Maximum overlap, see the glimmer documentation for the -o or -max\_olap parameter

*type: integer*  
*default: 50*  
*optional: True*

**stop\_codons** stop codons

*type: {}*  
*default: tag,tga,taa,nnn,tnn,ann,gnn,cnn*  
*optional: True*

**treshold** treshold for calling a gene a gene (glimmer3 -t)

*type: integer*  
*default: 30*  
*optional: True*

## **2.8.39 gmap**

**Gmap**

Run GMAP on an set of input files (query) vs a database index.

## Commands

**clean** Remove all job data, not the Moa job itself, note that this must be implemented by the template.

**run** *no help defined*

## Filesets

### align

*type: map*  
*source: input*  
*category: output*  
*optional: {}*  
*pattern: ./align/\*.align*

### genepred

*type: map*  
*source: input*  
*category: output*  
*optional: {}*  
*pattern: ./genepred/\*.genepred*

### gff

*type: map*  
*source: input*  
*category: output*  
*optional: {}*  
*pattern: ./gff/\*.gff*

### gff\_invert

*type: map*  
*source: input*  
*category: output*  
*optional: {}*  
*pattern: ./gff/\*.invert.gff*

**input** Sequences to map

### raw

*type: map*  
*source: input*  
*category: output*  
*optional: {}*  
*pattern: ./raw/\*.raw*

## Parameters

**db** Gmap db

*type: file*  
*default: ""*  
*optional: False*

**extra\_parameters** extra parameters to feed to gmap

*type: string*  
*default: ""*  
*optional: True*

**gff\_source** Source field to use in the output GFF

*type: string*  
*default: gmap*  
*optional: True*

**invert\_gff** Invert the GFF (T/F)

*type: set*  
*default: T*  
*optional: True*

## 2.8.40 gmapdb

### gmapdb index builder

Builds gmapdb index from a reference sequence

## Commands

**clean** Remove all job data, not the Moa job itself, note that this must be implemented by the template.

**run** *no help defined*

## Filesets

**input** The reference sequence to build a gmap database with.

*type: single*  
*category: input*  
*optional: False*  
*pattern: \*/\*.fasta*

## Parameters

**name** Name of the gmap index to create

*type: string*  
*default: gmapdb*  
*optional: True*

## miscellaneous

## 2.8.41 gsMapper

### GSMapper

Run the Roche GS Reference mapper

## Commands

**clean** Remove all job data, not the Moa job itself, note that this must be implemented by the template.

**run** *no help defined*

## Parameters

**annotation** Gene annotation file in the UCSC GenePred format

*type: file*  
*default: ""*  
*optional: True*

**min\_overlap\_ident** Minimum identity length in the assembly step

*type: integer*  
*default: 90*  
*optional: True*

**min\_overlap\_len** Minimum overlap length in the assembly step

*type: integer*  
*default: 40*  
*optional: True*

**name** Name identifying this mapping in the output gff

*type: string*  
*default: ""*  
*optional: False*

**reference\_fasta** A multifasta file with the reference sequence(s) with the library id.

*type: file*  
*default: ""*  
*optional: True*

**sfffile** SFF files with reads to map against the reference sequences

*type: file*  
*default: ""*  
*optional: True*

### 2.8.42 h\_blast

#### Hadoop Blast

Runs BLAST on a hadoop cluster

#### Commands

**clean** Remove all job data, not the Moa job itself, note that this must be implemented by the template.

**run** Similar to a normal blast, but now running on an hadoop cluster

#### Parameters

**db** Location of the blast database

*type: file*

*default: ""*

*optional: False*

**eval** e value cutoff

*type: float*

*default: 1e-10*

*optional: True*

**hadoop\_base** location of the hadoop installation

*type: directory*

*default: ""*

*optional: False*

**hdfs\_base** hdfs://SERVER:PORT for the hdfs filesystem, defaults to "hdfs://localhost:9000"

*type: string*  
*default: hdfs://localhost:9000*  
*optional: True*

**input\_dir** location of the hadoop installation

*type: directory*  
*default: ""*  
*optional: False*

**input\_extension** input file extension

*type: string*  
*default: fasta*  
*optional: True*

**nohits** number of hits to report

*type: integer*  
*default: 50*  
*optional: True*

**nothreads** threads to run blast with (note the overlap with the Make -j parameter)

*type: integer*  
*default: 1*  
*optional: True*

**program** blast program to use (default: blastn)

*type: set*  
*default: blastn*  
*optional: True*

## **miscellaneous**

### 2.8.43 hagfish

#### Run hagfish\_extract & hagfish\_combine

Run the preparatory steps for hagfish

#### Commands

**clean** remove all Hagfish files

**finish** finish up - find gaps - combine plots - create a report

**run** Run hagfish

#### Filesets

**fasta** fasta sequence of the reference

*type: single*  
*category: prerequisite*  
*optional: False*  
*pattern: {}*

**input** “hagfish” input files

**output** “hagfish” touch files - track what files are done - please do not touch this!

*type: map*  
*source: input*  
*category: output*  
*optional: True*  
*pattern: ./touch/\*.touch*

#### Parameters

**circosbinsize** Binsize for generating circos formatted histograms

*type: int*  
*default: {}*  
*optional: True*

**max\_ok** Maximal acceptable insert size for an aligned pair. If omitted, hagfish will make an estimate

*type: int*  
*default: 0*  
*optional: True*

**min\_ok** Minimal acceptable insert size for an aligned pair. If omitted, hagfish will make an estimate

*type: int*  
*default: 0*  
*optional: True*

### 2.8.44 kanga

use kanga to align short reads to a reference genome

### Commands

**clean** Remove all job data, not the Moa job itself, note that this must be implemented by the template.

**run** run kanga

### Filesets

**input\_fasta** Fasta input file

**output** output files

*type: map*  
*source: rds\_input*  
*category: output*  
*optional: True*  
*pattern: /\*.sam*

**output\_bam** output files

*type: map*  
*source: rds\_input*  
*category: output*  
*optional: True*  
*pattern: ./\*.bam*

**output\_log** output log file

*type: map*  
*source: rds\_input*  
*category: output*  
*optional: {}*  
*pattern: ./\*.log.txt*

**rds\_input** rds (preprocessed) input files

**sfx\_input** sfx array lookup file

## Parameters

**color\_space** process for colorspace (SOLiD)

*type: boolean*  
*default: False*  
*optional: True*

**extra\_params** any extra parameters

*type: string*  
*default: ""*  
*optional: True*

**help** print this help and exit

*type: boolean*  
*default: False*  
*optional: True*

**max\_Ns** maximum number of intermediate N's in reads before treating read as unalignable

*type: integer*  
*default: 1*  
*optional: True*

**max\_pair\_len** accept paired end alignments with apparent length of at most this

*type: integer*  
*default: 300*  
*optional: True*

**min\_pair\_len** accept paired end alignments with apparent length of at least this

*type: integer*  
*default: 100*  
*optional: True*

**no\_multireads** do not accept multiple reads aligning to the same loci

*type: boolean*  
*default: False*  
*optional: True*

**out\_format** 0 - CSV loci only, 1 - CSV loci + match sequence, 2 - CSV loci + read sequence, 3 - CSV loci + read + match sequence, 4 - UCSC BED, 5 - SAM format

*type: integer*  
*default: 0*  
*optional: True*

**pe\_mode** 0 - none, 1 - paired ends with recover orphan ends, 2 - paired end no orphan recovery

*type: integer*  
*default: 0*  
*optional: True*

**quality** fastq quality scoring- 0 - sanger, 1m - Illumina 1.3+, 2 - Solexa < 1.3, 3 - Ignore quality

*type: integer*

*default: 3*

*optional: True*

**thread\_num** number of processing threads (0 sets threads to number of CPU cores)

*type: integer*

*default: 0*

*optional: True*

**trim3** trim this number of bases from 3' end of reads when loading raw reads

*type: integer*

*default: 0*

*optional: True*

**trim5** trim this number of bases from 5' end of reads when loading raw reads

*type: integer*

*default: 0*

*optional: True*

**version** print version information and exit

*type: boolean*

*default: False*

*optional: True*

### **2.8.45 kangar\_pe**

use kangar to pre process raw fq reads

## Commands

**clean** Remove all job data, not the Moa job itself, note that this must be implemented by the template.

**run** run kangar

## Filesets

**fq\_forward\_input** fastq input files - forward - containing the 5' end

**fq\_reverse\_input** fastq input files directory - reverse - containing the 3' end

```
type: map
source: fq_forward_input
category: input
optional: True
pattern: */*_2.fq
```

**output\_log** output log file

```
type: map
source: fq_forward_input
category: output
optional: {}
pattern: ./*.log.txt
```

**rds\_output** output rds file

```
type: map
source: fq_forward_input
category: output
optional: True
pattern: ./*.rds
```

## Parameters

**extra\_params** any extra parameters

```
type: string
default: ""
optional: True
```

**help** print this help and exit

*type: boolean*

*default: False*

*optional: True*

**mode** processing mode 0 - single end create, 1 - paired end create, 2 - output statistics 3 - dump as fasta

*type: integer*

*default: 0*

*optional: True*

**quality** fastq quality scoring- 0 - sanger, 1m - Illumina 1.3+, 2 - Solexa < 1.3, 3 - Ignore quality

*type: integer*

*default: 3*

*optional: True*

**reads\_num** limit number of reads (or dumps) in each input file to this many, 0 if no limit

*type: integer*

*default: 0*

*optional: True*

**rm\_duplicates** remove duplicate reads retaining only one

*type: boolean*

*default: False*

*optional: True*

**trim3** trim this number of bases from 3' end of sequence

*type: integer*

*default: 0*

*optional: True*

**trim5** trim this number of bases from 5' end of sequence

*type: integer*  
*default: 0*  
*optional: True*

**version** print version information and exit

*type: boolean*  
*default: False*  
*optional: True*

## 2.8.46 kangar\_se

use kangar to pre process raw fq single end reads

## Commands

**clean** Remove all job data, not the Moa job itself, note that this must be implemented by the template.

**run** run kangar

## Filesets

**fq\_input** fastq input files - forward - containing the 5' end

**output\_log** output log file

*type: map*  
*source: fq\_input*  
*category: output*  
*optional: {}*  
*pattern: /\*.log.txt*

**rds\_output** output rds file

*type: map*

*source: fq\_input*  
*category: output*  
*optional: True*  
*pattern: ./\*.rds*

## Parameters

**extra\_params** any extra parameters

*type: string*  
*default: “*  
*optional: True*

**help** print this help and exit

*type: boolean*  
*default: False*  
*optional: True*

**mode** processing mode 0 - single end create, 1 - paired end create, 2 - output statistics 3 - dump as fasta

*type: integer*  
*default: 0*  
*optional: True*

**quality** fastq quality scoring- 0 - sanger, 1m - Illumina 1.3+, 2 - Solexa < 1.3, 3 - Ignore quality

*type: integer*  
*default: 3*

### 2.8.47 kangax

use kangax to create the suffix array lookup database for the reference genome

## Commands

**clean** Remove all job data, not the Moa job itself, note that this must be implemented by the template.

**run** run kangax

## Filesets

**input\_fasta** Fasta input file

**output\_log** output log file

*type: map*  
*source: input\_fasta*  
*category: output*  
*optional: {}*  
*pattern: ./\*.log.txt*

**output\_sfx** output suffix array lookup

*type: map*  
*source: input\_fasta*  
*category: output*  
*optional: {}*  
*pattern: ./\*.sfx*

## Parameters

**block\_seq\_len** generated suffix blocks to hold at most this length (MB) concatenated sequences

*type: integer*  
*default: 3300*  
*optional: True*

**color\_space** generate for colorspace (SOLiD)

*type: boolean*  
*default: False*  
*optional: True*

**extra\_params** any extra parameters

*type: string*  
*default: ""*  
*optional: True*

**help** print this help and exit

*type: boolean*  
*default: False*  
*optional: True*

**reference\_species** reference species

*type: string*  
*default: ""*  
*optional: False*

**target\_dep** generate target file only if missing or older than any independent source files

*type: boolean*  
*default: False*  
*optional: True*

**version** print version information and exit

*type: boolean*  
*default: False*  
*optional: True*

### 2.8.48 lftp

#### **lftp**

Use LFTP to download files. This template has two modi, one is set lftp\_mode to mirror data, in which case both lftp\_url and lftp\_pattern (default \*) are used. The other modus is lftp\_mode=get, when one file defined by lftp\_url is downloaded. In the mirror mode it is possible to download only those files that are newer as the files already downloaded by using the lftp\_timestamp parameter

## Commands

**clean** Remove all job data, not the Moa job itself, note that this must be implemented by the template.

**run** execute the download

## Parameters

**dos2unix** Run dos2unix to prevent problems with possible dos text files

*type: set*  
*default: F*  
*optional: True*

**get\_name** target name of the file to download

*type: string*  
*default: “*  
*optional: True*

**lftp\_output\_dir** subdir to create & write all output to. If not defined, data will be downloaded to directory containing the Makefile

*type: directory*  
*default: .*  
*optional: True*

**lock** Lock this job after running. This means that you will have to manually unlock the job before lftp actually reruns. This is a good choice if your downloading large datasets or have a slow connection

*type: set*  
*default: T*  
*optional: True*

**mode** Mode of operation - mirror or get. Mirror enables timestamping. Get just gets a single file. If using get, consider setting `depend_lftp_timestamp` to F. When using get, the full url should be in `lftp_url`. `lftp_pattern` is ignored. Defaults to mirror.

*type: set*  
*default: get*  
*optional: True*

**noclean** set of files not to be deleted by the powerclean

*type: string*  
*default: moa.mk Makefile*  
*optional: True*

**pass** password for the remote site, note that this can be defined on the commandline using: `make lftp_pass=PASSWORD`

*type: password*  
*default: “*  
*optional: True*

**pattern** glob pattern to download

*type: string*  
*default: ‘\*’*  
*optional: True*

**powerclean** Do brute force cleaning (T/F). Remove all files, except moa.mk & Makefile when calling `make clean`. Defaults to F.

*type: set*  
*default: F*  
*optional: True*

**timestamp** Depend on lftp to decide if a file needs updating, else a touchfile is created that you need to delete or touch before updating (T/F)

*type: set*  
*default: F*  
*optional: True*

**url** The base url to download from

*type: string*  
*default: “*  
*optional: True*

**user** username for the remote site

*type: string*  
*default: “*  
*optional: True*

## 2.8.49 map

**Execute a “map” ad-hoc analysis**

Execute one command, on a number of input files.

## Commands

**run** *no help defined*

## Filesets

**input** “map” input files

**output** “map” output files

*type: map*  
*source: input*  
*category: output*  
*optional: True*  
*pattern: ./\**

## Parameters

**dummy** do a dummy run

*type: boolean*  
*default: False*  
*optional: True*

**process** The command to execute

*type: string*  
*default: True*  
*optional: False*

## miscellaneous

### 2.8.51 map22

**Execute a “map22” ad-hoc analysis - two input files, two output files**

Execute one command, on a number of input files.

## Commands

**run** *no help defined*

## Filesets

**input1** “map” input files set 1

**input2** “map” input files set 2

*type: map*  
*source: input1*  
*category: input*  
*optional: False*  
*pattern: \*/\**

**output1** “map” output files

*type: map*  
*source: input1*  
*category: output*

*optional: True*  
*pattern: /\**

**output2** “map” output files

*type: map*  
*source: input1*  
*category: output*  
*optional: True*  
*pattern: /\**

## Parameters

**process** The command to execute

*type: string*  
*default: True*  
*optional: False*

## miscellaneous

**Backend** ruff

**Author** Mark Fiers

## 2.8.52 maq\_fasta2bfa

### Convert fasta to bfa

Converts a FASTA file to MAQ format for use with a BFA a maq\_fasta2bfa index from a reference sequence

## Commands

**clean** Remove all job data, not the Moa job itself, note that this must be implemented by the template.

**run** *no help defined*

## Filesets

**bfa**

*type: map*  
*source: input*  
*category: output*  
*optional: {}*  
*pattern: ./bfa/\*.bfa*

**input** input FASTA files

## Parameters

### miscellaneous

**Backend** gnumake

**Author** Mark Fiers

**Creation date** Wed Nov 10 07:56:48 2010

**Modification date** Wed Nov 10 07:56:48 2010

## 2.8.53 maq\_fastq2bfq

### Convert FASTQ to BFQ

Converts a FASTQ file to MAQ BFQ format.

## Commands

**clean** Remove all job data, not the Moa job itself, note that this must be implemented by the template.

**run** *no help defined*

## Filesets

### bfq

*type: map*  
*source: input*  
*category: output*  
*optional: {}*  
*pattern: ./bfq/\*.bfq*

**input** input FASTA files

## Parameters

### miscellaneous

**Backend** gnumake

**Author** Mark Fiers

**Creation date** Wed Nov 10 07:56:48 2010

**Modification date** Wed Nov 10 07:56:48 2010

## 2.8.54 maq\_match\_pair

### MAQ paired ends mapper

Map paired ends to a reference sequence using MAQ

### Commands

**clean** Remove all job data, not the Moa job itself, note that this must be implemented by the template.

**run** *no help defined*

### Parameters

**forward\_suffix** Suffix of each forward filename - recognize forward files this way. Note this is not a regular extension, no . is assumed between the filename & suffix

*type: string*

*default: \_f.bfq*

*optional: True*

**maxdist** max outer distance for a (non RF) readpair. This applies to illumina matepairs - i.e. short inserts

*type: integer*

*default: 250*

*optional: True*

**read\_dir** directory containing the forward reads

*type: string*

*default: ""*

*optional: False*

**reference** Reference bfa file to map the reads to

*type: string*

*default: ""*

*optional: False*

**reverse\_suffix** suffix of reverse files

*type: string*  
*default: \_r.bfq*  
*optional: True*

**RF\_maxdist** max outer distance for an RF readpair (corresponds to the -A parameter). This applies to long insert illumina pairs

*type: integer*  
*default: 15000*  
*optional: True*

## miscellaneous

**Backend** gnumake

**Author** Mark Fiers

**Creation date** Wed Nov 10 07:56:48 2010

**Modification date** Wed Nov 10 07:56:48 2010

## 2.8.55 maq\_pe

Generate alignments in SAM format given paired end reads using Maq.

## Commands

**clean** Remove all job data, not the Moa job itself

**run** run maq's fasta2bfa, fastq2bfq and map.

## Filesets

**bam\_output** bam alignment output file

*type: map*  
*source: fq\_forward\_input*  
*category: output*  
*optional: {}*  
*pattern: /\*.bam*

**bfa\_output** BFA Index name

*type: single*  
*category: other*  
*optional: {}*  
*pattern: {}*

**bfq\_forward\_output** bfq files - forward files

*type: map*  
*source: fq\_forward\_input*  
*category: output*  
*optional: {}*  
*pattern: ./\*\_1.bfq*

**bfq\_reverse\_output** bfq files - reverse files

*type: map*  
*source: fq\_forward\_input*  
*category: output*  
*optional: {}*  
*pattern: ./\*\_2.bfq*

**fa\_input** directory with reference fasta file name

**fq\_forward\_input** fastq input files directory - forward files

**fq\_reverse\_input** fastq input files directory - reverse files

*type: map*  
*source: fq\_forward\_input*  
*category: input*  
*optional: {}*  
*pattern: \*/\*\_2.fq*

**map\_output** maq map output files

*type: map*  
*source: fq\_forward\_input*  
*category: output*  
*optional: {}*  
*pattern: ./\*.map*

## Parameters

**disable\_sw** disable Smith-Waterman alignment

*type: boolean*  
*default: False*  
*optional: True*

**extra\_parameters** Any extra parameters

*type: string*  
*default: ""*  
*optional: True*

**first\_read\_len** length of the first read ( $\leq 127$ )s

*type: integer*  
*default: 0*  
*optional: True*

**match\_in\_colorspace** match in the colorspace

*type: boolean*  
*default: False*  
*optional: True*

**max\_dist\_read\_pairs** max distance between two paired reads s

*type: integer*  
*default: 250*  
*optional: True*

**max\_dist\_RF\_read\_pairs** max distance between two RF paired reads s

*type: integer*  
*default: 0*  
*optional: True*

**max\_mismatch\_qual\_sum** maximum allowed sum of qualities of mismatches

*type: integer*  
*default: 70*  
*optional: True*

**max\_num\_hits\_out** max number of hits to output. >512 for all 01 hits.

*type: integer*  
*default: 250*  
*optional: True*

**num\_mismatch\_24bp** number of mismatches in the first 24bp

*type: integer*  
*default: 2*  
*optional: True*

**read\_ref\_diff\_rate** rate of difference between reads and references

*type: float*  
*default: 0.001*  
*optional: True*

**sec\_read\_len** length of the second read (<=127)s

*type: integer*  
*default: 0*  
*optional: True*

**trim\_all\_reads** trim all reads (usually not recommended)

*type: boolean*  
*default: False*  
*optional: True*

### 2.8.56 maq\_se

Generate alignments in SAM format given single end reads using Maq.

#### Commands

**clean** Remove all job data, not the Moa job itself

**run** run maq's fasta2bfa, fastq2bfq and map.

#### Filesets

**bam\_output** bam alignment output file

*type: map*  
*source: fq\_input*  
*category: output*  
*optional: {}*  
*pattern: /\*.bam*

**bfa\_output** BFA Index name

*type: single*  
*category: other*  
*optional: {}*  
*pattern: {}*

**bfq\_output** bfq files - forward files

*type: map*  
*source: fq\_input*  
*category: output*  
*optional: {}*  
*pattern: /\*.bfq*

**fa\_input** directory with reference fasta file name

**fq\_input** fastq input files

**map\_output** maq map output files

*type: map*

*source: fq\_input*

*category: output*

*optional: {}*

*pattern: ./\*.map*

## Parameters

**disable\_sw** disable Smith-Waterman alignment

*type: boolean*

*default: False*

*optional: True*

**extra\_parameters** other parameters

*type: string*

*default: ""*

*optional: True*

**match\_in\_colorspace** match in the colorspace

*type: boolean*

*default: False*

*optional: True*

**max\_mismatch\_qual\_sum** maximum allowed sum of qualities of mismatches

*type: integer*

*default: 70*

*optional: True*

**max\_num\_hits\_out** number of mismatches in the first 24bp

*type: integer*  
*default: 250*  
*optional: True*

**num\_mismatch\_24bp** number of mismatches in the first 24bp

*type: integer*  
*default: 2*  
*optional: True*

**read\_ref\_diff\_rate** rate of difference between reads and references

*type: float*  
*default: 0.001*  
*optional: True*

**trim\_all\_reads** trim all reads (usually not recommended)

*type: boolean*  
*default: False*  
*optional: True*

## 2.8.57 moatest

**Unittest template**

Not to be used - is used by unitmoatests

## Commands

**clean** Remove all job data, not the Moa job itself, note that this must be implemented by the template.

**run** Do nothing - no need to call this.

## Parameters

**test\_opt** test variable

*type: string*  
*default: konijntje*  
*optional: True*

**txt** test variable

*type: string*  
*default: “*  
*optional: False*

## miscellaneous

## 2.8.58 mummer

**mummer**

Run mummer between two sequences

## Commands

**clean** Remove all job data, not the Moa job itself, note that this must be implemented by the template.

**run** Run mummer

## Filesets

**input** Set 1 input fasta files

**reference** Set 1 input fasta files

## Parameters

**base** base name for all generated files

*type: {}*  
*default: out*  
*optional: True*

**breaklen** Set the distance an alignment extension will attempt to extend poor scoring regions before giving up (default 200)

*type: integer*  
*default: 200*  
*optional: True*

**genomecenter** genome center - used in the AGP file

*type: {}*  
*default: pflnz*  
*optional: True*

**gff\_source** GFF source field

*type: {}*  
*default: mumscaff*  
*optional: True*

**linker** linker sequence for the merged output sequence

*type: {}*  
*default: NNNNNNCTAGCTAGCATGNNNNNN*  
*optional: True*

**matchmode** use all matching fragments (max) or only unique matchers (mum)

*type: set*  
*default: mum*  
*optional: True*

**mum\_plot\_raw** plot an alternative visualization where mummer does not attempt to put the sequences in the correct order

*type: boolean*  
*default: False*  
*optional: True*

**organism** Organism name - used in the AGP file

*type: {}*  
*default: ""*  
*optional: True*

**taxid** Taxonomy id - used in the AGP file

*type: {}*  
*default: ""*  
*optional: True*

## 2.8.59 ncbi

### Download data from NCBI

Download a set of sequences from NCBI based on a query string *ncbi\_query* and database *ncbi\_db*. This template will run only **once**, after a successful run it creates a lock file that you need to remove to rerun

## Commands

**clean** Remove all job data, not the Moa job itself, note that this must be implemented by the template.

**run** Download from NCBI

## Parameters

**db** NCBI database

*type: string*

*default: nuccore*

*optional: True*

**query** NCBI query (for example txid9397[Organism%3Aexp])

*type: string*

*default: ""*

*optional: True*

**rename\_sequence** try to rename the sequence - note, this does not work if you are downloading more than one sequence

*type: boolean*

*default: False*

*optional: True*

**sequence\_name** Name of the file to write the downloaded sequences to. Use 'from\_dir' to have the sequence name extracted from the directory name

*type: string*

*default: out*

*optional: True*

## **miscellaneous**

### **2.8.60 newbler**

#### **Newbler**

Run a simple, out of the box, newbler assembly. As an extra feature, this template automatically creates uniquely named links to the two main output fasta files (454AllContigs.fna, 454LargeContigs.fna). This is convenient for subsequence gather steps. The links are named after the directory.

### Commands

**clean** Remove all job data, not the Moa job itself, note that this must be implemented by the template.

**run** *no help defined*

### Filesets

**input** input SFF files

### Parameters

**largecontig\_cutoff** min length of a contig in 454LargeContigs.fna

*type: integer*  
*default: “*  
*optional: True*

**library\_name** A library identifier for this assembly. This is used to create an extra fasta file, named using this variable, that contain the generated contigs with their ids prepended with the library id.

*type: string*  
*default: \$(shell echo ‘basename \$(CURDIR) | sed “s/[ ///]/g” )’*  
*optional: True*

**mid\_configuration** Mid configuration file to use

*type: file*  
*default: “*  
*optional: True*

**mids** mids to use for this assembly

*type: string*  
*default: “*  
*optional: True*

**min\_identity** Minimal overlap identity used during assembly

*type: integer*

*default: “*  
*optional: True*

### **2.8.61 newjobtest**

**Execute a “simple” ad hoc analysis**

Execute one command, No in or output files are tracked by Moa.

## **Commands**

**run** *no help defined*

## **Parameters**

**process** The command to execute

*type: string*  
*default: True*  
*optional: False*

## **miscellaneous**

**Backend** ruff

**Author** Mark Fiers

**Creation date** Tue Mar 29 16:34:19 2011

**Modification date** Wed Mar 30 06:02:01 2011

### **2.8.62 nstretch**

**Nstretch**

Run NSTRETCH on an set of input files

## Commands

**clean** Remove all job data, not the Moa job itself, note that this must be implemented by the template.

**run** *no help defined*

## Parameters

**input\_dir** input dir with the fasta files

*type: directory*

*default: ""*

*optional: False*

**input\_extension** extension of the input files

*type: string*

*default: fasta*

*optional: True*

**len** minimal number of Ns before its reported (default 10)

*type: integer*

*default: 10*

*optional: True*

## miscellaneous

**Backend** gnumake

**Creation date** Wed Nov 10 07:56:48 2010

**Modification date** Wed Nov 10 07:56:48 2010

## 2.8.63 orthomcl

### Run OrthoMCL

Execute one command, No in or output files are tracked by Moa.

## Commands

**run** *no help defined*

## Parameters

**db** Db name

*type: string*  
*default: {}*  
*optional: False*

**eval** Evalute cutoff for blast to use

*type: string*  
*default: 1e-5*  
*optional: True*

**group\_prefix** OrthoMCL prefix for group names

*type: string*  
*default: g\_*  
*optional: True*

**host** Db Host

*type: localhost*  
*default: {}*  
*optional: True*

**input\_dir** Input directory with compliant (read the manual) fasta files

*type: string*  
*default: {}*  
*optional: False*

**login** Db username

*type: string*  
*default: None*  
*optional: False*

**mcl\_i** mcl -i value

*type: float*  
*default: 1.5*  
*optional: True*

**num\_threads** Number of threads to use

*type: integer*  
*default: 4*  
*optional: True*

**pass** Db password

*type: string*  
*default: None*  
*optional: False*

**port** Db port

*type: integer*  
*default: 3306*  
*optional: True*

**prefix** OrthoMCL prefix for the database tables

*type: string*  
*default: ortho*  
*optional: True*

**vendor** Db vendor

*type: string*  
*default: mysql*  
*optional: True*

## miscellaneous

**Creation date** Tue Mar 29 16:34:19 2011

**Modification date** Wed Mar 30 06:02:01 2011

## 2.8.64 pregap

### Pregap

Run Pregap. Note that running phrap could be a part of this.

### Commands

**clean** Remove all job data, not the Moa job itself, note that this must be implemented by the template.

**run** *no help defined*

### Parameters

**cloning\_vector** File containing the cloning vector

*type: file*

*default: ""*

*optional: False*

**ecoli\_screenseq** File containing ecoli screen sequences

*type: file*

*default: ""*

*optional: False*

**input\_dir** Directory with the input data

*type: string*

*default: ""*

*optional: False*

**input\_pattern** file name pattern

*type: string*  
*default: ""*  
*optional: False*

**quality\_value\_clip** quality cutoff

*type: integer*  
*default: 10*  
*optional: True*

**repeat\_masker\_lib** File with a repeatmasker library

*type: file*  
*default: ""*  
*optional: False*

**sequencing\_vector** File containing the sequencing vector

*type: file*  
*default: ""*  
*optional: False*

**template** the template pregap config file to use. if not defined, Moa tries ./files/pregap.config.

*type: file*  
*default: ./files/pregap.config.*  
*optional: True*

**vector\_primerfile** File with the vector primers

*type: file*  
*default: ""*  
*optional: False*

## **miscellaneous**

**Backend** gnumake

**Creation date** Wed Nov 10 07:56:48 2010

**Modification date** Wed Nov 10 07:56:48 2010

## 2.8.65 project

### Create a project

Placeholder for a Moa Project

### Commands

**run** This template does not do anything - it is a project placeholder.

### Parameters

#### miscellaneous

**Backend** ruff

**Author** Mark Fiers

**Creation date** Tue, 10 Jan 2012 14:54:39 +1300

**Modification date** Wed Nov 10 07:56:48 2010

## 2.8.66 reduce

### Execute a “reduce” ad-hoc analysis

Execute one command, on a number of input files.

### Commands

**run** *no help defined*

### Filesets

**input** “reduce” input files

**output** “reduce” output files

*type: single*

*category: output*

*optional: True*

*pattern: ./\**

## Parameters

**process** The command to execute

*type: string*  
*default: True*  
*optional: False*

## miscellaneous

**Backend** ruff

**Author** Mark Fiers

**Creation date** Tue Mar 29 16:34:19 2011

**Modification date** Wed Mar 30 06:02:01 2011

## 2.8.67 sam2bam

**Convert SAM to BAM using samtools**

Converts a FASTQ file to MAQ BFQ format.

## Commands

**clean** Remove all job data, not the Moa job itself, note that this must be implemented by the template.

**run** *no help defined*

## Filesets

**input** input SAM files

**output**

*type: map*  
*source: input*  
*category: output*  
*optional: {}*  
*pattern: ./\*.bam*

## Parameters

## miscellaneous

**Backend** gnumake

**Author** Mark Fiers

**Creation date** Wed Nov 10 07:56:48 2010

**Modification date** Wed Nov 10 07:56:48 2010

## 2.8.68 samtools\_pileup

Print the alignment in the pileup format.

### Commands

**clean** Remove all job data, not the Moa job itself

**run** run samtools pileup command

### Filesets

**fasta** reference fasta file

*type: single*  
*category: prerequisite*  
*optional: True*  
*pattern: \*/\*.fasta*

**input** bam or sam files

**output**

*type: map*  
*source: input*  
*category: output*  
*optional: {}*  
*pattern: ./\*.pileup*

**output\_bam**

*type: map*  
*source: input*  
*category: output*  
*optional: {}*  
*pattern: ./\*.sorted*

### Parameters

**cap\_mapQ\_at** cap mapping quality at INT

*type: integer*  
*default: 60*

*optional: True*

**extra\_params** any extra parameters

*type: string*

*default: ""*

*optional: True*

**filter\_read\_bits** filtering reads with bits in INT

*type: integer*

*default: 1796*

*optional: True*

**input\_is\_SAM** the input is in SAM

*type: boolean*

*default: False*

*optional: True*

**num\_haplotypes** number of haplotypes in the sample (for -c/-g)

*type: integer*

*default: 2*

*optional: True*

**out\_2nd\_best** output the 2nd best call and quality

*type: boolean*

*default: False*

*optional: True*

**out\_GLFv3\_format** output in the GLFv3 format (suppressing -c/-i/-s)

*type: boolean*

*default: False*

*optional: True*

**out\_maq\_consensus** output the maq consensus sequence

*type: boolean*  
*default: False*  
*optional: True*

**phred\_prob\_indel** phred prob. of an indel in sequencing/prep. (for -c/-g)

*type: integer*  
*default: 40*  
*optional: True*

**print\_variants\_only** print variants only (for -c)

*type: boolean*  
*default: False*  
*optional: True*

**prior\_diff\_haplotypes** phred prob. of an indel in sequencing/prep. (for -c/-g)

*type: float*  
*default: 0.001*  
*optional: True*

**prior\_indel\_haplotypes** number of haplotypes in the sample (for -c/-g)

*type: float*  
*default: 0.00015*  
*optional: True*

**show\_lines\_indels** only show lines/consensus with indels

*type: boolean*  
*default: False*  
*optional: True*

**simple\_pileup\_format** simple (yet incomplete) pileup format

*type: boolean*

*default: False*

*optional: True*

**theta\_maq\_model** number of haplotypes in the sample (for -c/-g)

*type: float*

*default: 0.85*

*optional: True*

**use\_SOAPsnp\_model** use the SOAPsnp model for SNP calling

*type: boolean*

*default: False*

*optional: True*

## 2.8.69 sffinfo

### sffinfo

Roche sffinfo tool - extract information from sff files

## Commands

**clean** Remove all job data, not the Moa job itself, note that this must be implemented by the template.

**run** Use the Roche sffinfo tool to extract reads, quality scores, flowgrams and accession ids from one or more sff files

## Filesets

### accession

*type: map*

*source: input*

*category: output*

*optional: {}*  
*pattern: ./\*.acc*

**flowgram**

*type: map*  
*source: input*  
*category: output*  
*optional: {}*  
*pattern: ./\*.flow*

**input** Sff input files

**quality**

*type: map*  
*source: input*  
*category: output*  
*optional: {}*  
*pattern: ./\*.qual*

**sequence**

*type: map*  
*source: input*  
*category: output*  
*optional: {}*  
*pattern: ./\*.reads*

## Parameters

**accessions** Output the accessions

*type: set*  
*default: T*  
*optional: True*

**flowgrams** output the flowgrams

*type: set*  
*default: F*  
*optional: True*

**quality** Output quality scores

*type: set*

*default: T*  
*optional: True*

**sequences** Output the sequences

*type: set*  
*default: T*  
*optional: True*

**untrimmed** output untrimmed sequences & qualities

*type: set*  
*default: F*  
*optional: True*

## 2.8.70 simple

**Execute a “simple” ad hoc analysis**

Execute one command, No in or output files are tracked by Moa.

## Commands

**run** *no help defined*

## Parameters

**process** The command to execute

*type: string*  
*default: True*  
*optional: False*

## miscellaneous

### 2.8.71 smalt\_pe

Run SMALT on an set of input files (query) vs a database index.

#### Commands

**clean** Remove all job data, not the Moa job itself

**run** Execute SMALT with with paired-end fastq

#### Filesets

**db** The (basename of the) smalt database to use.

*type: single*  
*category: prerequisite*  
*optional: False*  
*pattern: ../10.smaltdb/db*

**fasta** reference fasta file

*type: single*  
*category: prerequisite*  
*optional: False*  
*pattern: \*.fasta*

**fq\_forward\_input** fastq input files directory - forward

**fq\_reverse\_input** fastq input files directory - reverse

*type: map*  
*source: fq\_forward\_input*  
*category: input*  
*optional: True*  
*pattern: \*/\*\_2.fq*

**output** output BAM file (automatically converted & filtered for reads that to not map)

*type: map*  
*source: fq\_forward\_input*  
*category: output*  
*optional: {}*  
*pattern: /\*.sam*

## Parameters

**extra\_params** extra parameters to feed to smalt

*type: string*  
*default: ""*  
*optional: True*

**max\_insertsize** Maximum allowed insertsize

*type: integer*  
*default: 250*  
*optional: True*

**min\_insertsize** Minimum allowed insertsize

*type: integer*  
*default: 1*  
*optional: True*

**output\_format** output format (sam or samsoft)

*type: {}*  
*default: sam*  
*optional: True*

**pairtype** pair type (pe: fr/illumina short; mp: rf/illumina mate pairs or pp: ff

*type: {}*  
*default: pe*

*optional: True*

**threads** No threads to use

*type: int*

*default: 4*

*optional: True*

## 2.8.72 smaltdb

### Smalt index builder

Builds a smalt index from a reference sequence

## Commands

**clean** Remove all job data, not the Moa job itself, note that this must be implemented by the template.

**run** Create the smalt index

## Filesets

**input** Input fasta file for the smalt database

*type: single*

*category: input*

*optional: False*

*pattern: \*/\*.fasta*

**output** database name to create

*type: single*

*category: output*

*optional: {}*

*pattern: db*

## Parameters

**word\_length** word length

*type: int*  
*default: 10*  
*optional: True*

**word\_spacing** word spacing

*type: int*  
*default: 6*  
*optional: True*

## 2.8.73 soapdenovo\_pe

Run Soapdenovo

## Commands

**clean** Remove all job data

**run** Execute soapdenovo in paired-end mode

## Filesets

**fq\_forward** fastq input files directory - forward

**fq\_reverse** fastq input files directory - reverse

*type: map*  
*source: fq\_forward*  
*category: input*  
*optional: True*  
*pattern: \*/\*\_2.fq*

**output** soap denovo output file

*type: single*  
*category: output*  
*optional: True*  
*pattern: {}*

## Parameters

**avg\_insert** library insert size

*type: integer*  
*default: 200*  
*optional: {}*

**executable** which executable to use (SOAPdenovo-127mer, SOAPdenovo-31mer or SOAPdenovo-63mer)

*type: {}*  
*default: SOAPdenovo-31mer*  
*optional: True*

**kmer** kmer size

*type: integer*  
*default: 31*  
*optional: True*

**skip\_config\_file** skip automatic config file generation - if you skip this, make sure that you have a soap.config configuration file in the current directory

*type: boolean*  
*default: False*  
*optional: True*

**threads** no threads to use

*type: integer*

*default: 8*  
*optional: True*

### 2.8.74 statsidx

Retrieve and print stats from BAM file to an index file

## Commands

**clean** Remove all job data, not the Moa job itself

**run** run samtools idxstats

## Filesets

**input** bam input files directory - forward files

**output**

*type: map*  
*source: input*  
*category: output*  
*optional: {}*  
*pattern: /\*.index*

## Parameters

### miscellaneous

**Backend** ruff

**Author** Yogini Idnani, Mark Fiers

**Creation date** Wed Dec 08 17:06:48 2010

**Modification date** unknown

### 2.8.75 sync

#### Sync directories

Create this directory in sync with another directory

#### Commands

**run** Sync!

#### Parameters

**ignore** ignore these names (space separated list)

*type: {}*  
*default: ""*  
*optional: True*

**original** The local directory to use as a source. If the target (based on what is in the source) does not exist, this directory is copied. If the target exists - only the configuration is copied, and all directory contents are left alone. If this parameter is omitted, the directory with the most recently changed moa configuration.

*type: string*  
*default: {}*  
*optional: True*

**recursive** copy the jobs/config recursively

*type: boolean*  
*default: False*  
*optional: True*

**source** The directory to keep in sync with

*type: string*  
*default: {}*  
*optional: False*

## miscellaneous

### 2.8.76 unittest

Template used in testing - has no other purpose

## Commands

**clean** Remove all job data

**prepare** prepare for the unittest

**run** Prepare & Run

**run** delegates execution to: **prepare**, **run2**

**run2** actually run

## Filesets

**input\_1** Input file set 1

**input\_2** Input file set 2

```
type: map
source: input_1
category: input
optional: {}
pattern: in2/*_2.txt
```

**output** output files

```
type: map
source: input_1
category: output
optional: {}
pattern: /*.out
```

## Parameters

**test\_string** Test string values

*type: string*  
*default: {}*  
*optional: True*

## miscellaneous

**Backend** ruff

**Author** Yogini Idnani, Mark Fiers

**Creation date** Wed Nov 25 17:06:48 2010

## 2.8.77 varscan

### Varscan

Run VARSCAN to detect snps

## Commands

**clean** Remove all job data, not the Moa job itself, note that this must be implemented by the template.

**run** *no help defined*

## Parameters

**extra\_params** location of varscan.pl, defaults to /usr/lib/perl5/site\_perl/5.8.8/varscan.pl

*type: string*  
*default: ""*  
*optional: True*

**input\_file** Varscan input alignments file

*type: file*  
*default: ""*  
*optional: True*

**output\_name** Base name of the output files

*type: string*  
*default: out*  
*optional: True*

**perl\_file** the varscan (perl) executable

*type: file*  
*default: ""*  
*optional: True*

## miscellaneous

## 2.8.78 vpcr

### VPCR

Virtual PCR, based on Bowtie

### Commands

**clean** Remove all job data, not the Moa job itself, note that this must be implemented by the template.

**run** Predict the fragments that would be generated by a PCR

### Parameters

**bowtie\_db** Location of the bowtie database used for the vpcr

*type: file*  
*default: ""*  
*optional: True*

**insert\_max** maximum insert size for a vpcr fragment

*type: integer*  
*default: 10000*  
*optional: True*

**insert\_min** minimal insert size for a fragment

*type: integer*  
*default: 10*  
*optional: True*

**primer\_1** First primer to use

*type: string*  
*default: ""*  
*optional: False*

**primer\_2** Second primer to use

*type: string*  
*default: ""*  
*optional: False*

## **miscellaneous**

### **2.8.79 vpcr\_list**

Virtual PCR, based on Bowtie

## **Commands**

**clean** Remove all job data, not the Moa job itself, note that this must be implemented by the template.

**run** Predict the fragments that would be generated by a PCR

## **Parameters**

**bowtie\_db** Location of the bowtie database used for the vpcr

*type: file*

*default: ""*  
*optional: False*

**insert\_max** maximum insert size for a vpcr fragment

*type: integer*  
*default: 10000*  
*optional: True*

**insert\_min** minimal insert size for a fragment

*type: integer*  
*default: 10*  
*optional: True*

**primer\_list** List of primers to check

*type: file*  
*default: {}*  
*optional: False*

## miscellaneous

**Backend** gnumake

**Author** Mark Fiers

**Creation date** Wed Nov 10 07:56:48 2010

**Modification date** Wed Nov 10 07:56:48 2010

## 2.8.80 wget

### wget

Use WGET to download files. This template has two modi, one is set wget\_mode to mirror data, in which case both wget\_url and wget\_pattern (default \*) are used. The other modus is wget\_mode=get, when one file defined by wget\_url is downloaded. In the mirror mode it is possible to download only those files that are newer as the files already downloaded by using the wget\_timestamp parameter

## Commands

**run** Download

## Parameters

**pass** Password for the remote site (note - this is not very safe, the password will be stored in plan text)

*type: password*  
*default: ""*  
*optional: True*

**url** The url of the file to download

*type: string*  
*default: {}*  
*optional: False*

**user** Username for the remote site

*type: string*  
*default: ""*  
*optional: True*

## miscellaneous

**Backend** ruff

**Author** Mark Fiers

**Modification date** Thu, 02 Jun 2011 10:22:53 +1200

## 2.9 Moa API

### 2.9.1 moa.actor

‘Simple’ wrapper around subprocess to execute code

`moa.actor.getLastStderr(job)`  
Get the last stderr

`moa.actor.getLastStdout(job)`  
Get the last stdout

`moa.actor.getRecentOutDir(job)`  
Return the most recent output directory

```
moa.actor.simpleRunner (wd, cl, conf={}, **kwargs)
```

Don't think - just run - here & now

what does this function do? - put env in the environment - Execute the commandline (in cl) - store stdout & stderr in log files - return the rc

## 2.9.2 moa.commands

Handle Moa commands (i.e. anything that you can run as *moa COMMAND* on the commandline

## 2.9.3 moa.job

```
class moa.job.Job (wd)
```

Class defining a single job

Note - in the moa system, there can be only one current job - many operations try to access the job in sysConf

```
>>> wd = tempfile.mkdtemp()
>>> job = Job(wd)
>>> assert(isinstance(job, Job))
>>> assert(job.template.name == 'nojob')
```

```
checkCommands (command)
```

Check command, and rearrange if there are delegates.

```
>>> job = newTestJob('unittest')
>>> assert(job.template.commands.run.delegate == ['prepare', 'run2'])
>>> assert(job.checkCommands('run2') == ['run2'])
>>> assert(job.checkCommands('run') == ['prepare', 'run2'])
>>> assert(job.checkCommands('prepare') == ['prepare'])
```

**Parameters** *commands* (list of strings) – The list of commands to check

**Returns** The checked list of commands

**Return type** list of strings

```
checkConfDir ()
```

Check if the configuration directory exists. If not create it.

```
>>> job = newTestJob('unittest')
>>> confdir = os.path.join(job.wd, '.moa')
>>> assert(os.path.exists(confdir))
>>> import shutil
>>> shutil.rmtree(confdir)
>>> assert(os.path.exists(confdir) == False)
>>> job.checkConfDir()
>>> assert(os.path.exists(confdir))
```

```
defineCommands (commandparser)
```

Register template commands with the argparser

```
defineOptions (parser)
```

Set command line options - deferred to the backend - PER COMMAND

```
>>> job = newTestJob('unittest')
>>> import optparse
>>> parser = optparse.OptionParser()
>>> job.defineOptions(parser)
```

**execute** (*job*, *args*, *\*\*kwargs*)

Execute *command* in the context of this job. Execution is always deferred to the backend

#Note: Uncertain how to test verbose & silent

#### Parameters

- **verbose** (*Boolean*) – output lots of data
- **silent** (*Boolean*) – output nothing

**finishExecute** ()

Finish the run!

**getFiles** ()

Return all moa files - i.e. all files crucial to this job.

**hasCommand** (*command*)

Check if this job defines a certain command

**Warning:** THIS METHOD DOES NOT WORK PROPERLY YET

```
>>> job = newTestJob('unittest')
>>> assert (job.hasCommand('run'))
>>> assert (not job.hasCommand('dummy'))
```

**initialize** ()

Initialize a new job in the current wd

**isMoa** ()

Check if this is a Moa directory - Currently, this needs to be overridden #weird; uncertain if this ever gets called

**loadBackend** ()

load the backend

**loadTemplate** ()

Load the template for this job, based on what configuration can be found

**loadTemplateMeta** ()

Load the template meta data for this job, based on what configuration can be found

**prepareExecute** ()

Give this job a chance to prepare for execution.

**refreshTemplate** ()

Reload the template into the local .moa/template.d directory

```
>>> job = newTestJob('unittest')
>>> templateFile = os.path.join(job.confDir, 'template.d', 'unittest.jinja2')
>>> assert (os.path.exists(templateFile))
>>> os.unlink(templateFile)
>>> assert (not os.path.exists(templateFile))
```

```
>>> job.refreshTemplate()
>>> assert(os.path.exists(templateFile))
```

**run\_hook** (*hook*, *\*\*kwargs*)  
Shortcut to run a job plugin hook

**setTemplate** (*name*, *provider=None*)  
Set a new template for this job

```
>>> job = newTestJob('unittest')
>>> job.setTemplate('adhoc')
>>> afile = os.path.join(job.confDir, 'template.d', 'adhoc.mk')
>>> assert(os.path.exists(afile))
```

**moa.job.newJob** (*wd*, *template*, *title*, *parameters=[]*, *provider=None*)  
Create a new job in the wd and return the proper job object currently only makefile jobs are supported - later we'll scan the template, and instantiate the proper job type

```
>>> wd = tempfile.mkdtemp()
>>> job = newJob(wd, template='blast', title='test')
>>> assert(isinstance(job, Job))
>>> assert(job.template.name == 'blast')
>>> assert(job.conf.title == 'test')
```

#### Parameters

- **wd** – Directory to create this job in, note that this directory must already exist
- **template** (*String*) – Template name for this job
- **parameters** (*list of (key, value) tuples*) – A list of parameters to set for this job

**Return type** instance of `moa.job.Job`

**moa.job.newTestJob** (*template*, *title='Test job'*, *provider=None*)  
for testing purposes - creates a temporary directory and uses that to instantiate a job. This function returns the job object created

```
>>> job = newTestJob(template = 'adhoc', title='test title')
>>> assert(isinstance(job, Job))
>>> assert(os.path.exists(job.wd))
>>> assert(job.conf.title == 'test title')
>>> assert(os.path.exists(os.path.join(job.wd, '.moa')))
>>> assert(os.path.exists(os.path.join(job.wd, '.moa', 'template')))
>>> assert(job.template.name == 'adhoc')
```

**Returns** the created job

**Return type** instance of `moa.job.Job`

## 2.9.4 moa.jobConf

moa job configuration

**class** `moa.jobConf.JobConf (job)`  
to distinguish between attributes of this object & proper job configuration parameters

**doNotCheck = None**  
these fields are not be type-checked

**doNotSave = None**  
these fields are not to be saved

**getRendered (key)**  
Get the rendered value of this key

**isEmpty ()**  
Check if the config is empty is empty

**isPrivate (k)**  
Is this a private variable? can be locally defined or in the template definition

**keys ()**  
return a dict with all known parameters and values, either defined in the job configuration of the template

**load (confFile, delta=None)**  
Load a configuration file

**Parameters delta** – if a value appears to be a relative path, try to correct for this.  
Currently this only works for files that exist. i.e.

**private = None**  
these fields are private (i.e. not to be displayed by default)

**save ()**  
Save the conf to disk

**setRecursiveVar (k, v)**  
Register a recursive variable

### 2.9.5 moa.sysConf

Store Moa wide configuration

### 2.9.6 moa.ui

communicate information to the user

### 2.9.7 moa.utils

A set of random utilities used by Moa

`moa.utils.deprecated (func)`  
Decorator function to flag a function as deprecated

**Parameters func** – any function

`moa.utils.flog (f)`  
A simple logger - uses the `moa.logger` code to log the calling function. Use as a decorator:

```
@moa.utils.flog
def any_function(*args);
    ...
```

This is for debugging purposes (obviously)

**Parameters** `func` – Any python function

`moa.utils.getMoaBase()`

Return MOABASE - the directory where Moa is installed. This function also sets an environment variable `MOABASE`

```
>>> d = getMoaBase()
>>> assert os.path.isdir(d)
>>> assert os.path.isfile(os.path.join(d, 'README'))
>>> assert os.path.isdir(os.path.join(d, 'lib'))
```

**Return type** string (path)

`moa.utils.getProcessInfo(pid)`

Return some info on a process

`moa.utils.moaDirOrExit(job)`

Check if the job contains a proper Moa job, if not, exit with an error message and a non-zero exit code.

**Parameters** `job` – An instance of `moa.job.Job`

`moa.utils.simple_decorator(decorator)`

This decorator can be used to turn simple functions into well-behaved decorators, so long as the decorators are fairly simple. If a decorator expects a function and returns a function (no descriptors), and if it doesn't modify function attributes or docstring, then it is eligible to use this. Simply apply `@simple_decorator` to your decorator and it will automatically preserve the docstring and function attributes of functions to which it is applied.

Note; I got this code from somewhere, but forgot where exactly. This seems the most likely source:

<http://svn.navi.cx/misc/trunk/djblets/djblets/util/decorators.py>

## 2.9.8 moa.template

### moa.template

Store information on a template. This module is also responsible for retrieving template information.

`moa.template.initTemplate(*args, **kwargs)`

`moa.template.installTemplate(wd, tName, provider=None)`

Initialize the template - this means - try to figure out where the template came from & copy the template files into `job/.moa/template` & `job/.moa/template.d/extra`.

Currently all templates come from the moa repository. In the future, multiple sources must be possible

```
>>> import tempfile
>>> wd = tempfile.mkdtemp()
>>> installTemplate(wd, 'adhoc')
>>> templateFile = os.path.join(wd, '.moa', 'template')
>>> adhocFile = os.path.join(wd, '.moa', 'template.d', 'adhoc.mk')
>>> assert os.path.exists(templateFile)
>>> assert os.path.exists(adhocFile)
```

`moa.template.refresh(wd)`

Refresh the template - try to find out what the template is from `{{wd}}/.moa/template.d/meta`. If that doesn't work, revert to the default template. If default is not specified - exit with an error

```
>>> import tempfile
>>> wd = tempfile.mkdtemp()
>>> installTemplate(wd, 'adhoc')
>>> templateFile = os.path.join(wd, '.moa', 'template')
>>> adhocFile = os.path.join(wd, '.moa', 'template.d', 'adhoc.mk')
>>> os.unlink(adhocFile)
>>> os.unlink(templateFile)
>>> assert(not os.path.exists(templateFile))
>>> assert(not os.path.exists(adhocFile))
>>> refresh(wd)
>>> assert(os.path.exists(templateFile))
>>> assert(os.path.exists(adhocFile))
```

## moa.template.template

Store information on a template. This module is also responsible for retrieving template information.

**class** `moa.template.template.Template(templateFile)`

Template extends Yaco

**getRaw()**

Return a Yaco representation of the yaml-template, without any of this Template processing. This is really useful when processing a template that needs to be written back to disk

```
>>> import moa.job
>>> job = moa.job.newTestJob(template='adhoc')
>>> raw = job.template.getRaw()
>>> assert(isinstance(raw, Yaco.Yaco))
>>> assert(raw.has_key('parameters'))
```

## 2.9.9 moa.template.provider

### moa.provider.core

Provides templates from the Moa package.

## 2.9.10 moa.backend

### Ruff

Ruffus (and Jinja) Backend

members

## 2.9.11 moa.plugin

### metavar - Create a number of meta variables

Set a number of meta variables to be used in job configuration. Variable that are currently created are:

(Assuming we're in the directory: */tmp/this/is/a/test*)

`_` name of the current directory. In the example, `_` renders to *test*

`__` name of the parent directory - (example: *a*)

`___` name of the parent directory - (example: *is*)

*dir1* same as `_`

*dir2* same as `__`

*dir3* same as `___`

*dir4* parent directory of *dir3*

Also a number of contextual variables are defined. In the same example as above, based on the directory name, the following variables are defined:

- `__tmp:` */tmp*
- `__this:` */tmp/this*
- `__is:` */tmp/this/is*
- `__a:` */tmp/this/is/a*
- `__test:` */tmp/this/is/a/test*

Note that numerical prefixes are stripped from directory names. So, for example: */tmp/this/10.is/444.a/test* would result in the same variable names as mentioned above (but with different directories). Also, [**A-Z**a-z**0-9**\_] in variable names are converted to underscores to become valid python variable names.

(for backwards compatibility - `_tmp` versions are also defined with the same value)

Additional contextual variables are, based on the following example directory structure (with `cwd` being */tmp/test/20.dirc/20.subb/*):

```
/tmp/test/00.dira/  
/tmp/test/10.dirb/  
/tmp/test/20.dirc/  
/tmp/test/20.dirc/10.suba/  
/tmp/test/20.dirc/20.subb/  
/tmp/test/20.dirc/30.subc/  
/tmp/test/20.dirc/40.subd/  
/tmp/test/30.dird/
```

`_f:` *10.suba* `_p:` *10.suba* `_n:` *30.subc* `_l:` *40.subd*

`__f:` */tmp/test/20.dirc/10.suba* `__p:` */tmp/test/20.dirc/10.suba* `__n:` */tmp/test/20.dirc/30.subc* `__l:` */tmp/test/20.dirc/40.subd*

```
_ff: 00.dira _pp: 10.dirb _nn: 30.dird _ll: 30.dird
```

```
__ff: /tmp/test/00.dira __pp: /tmp/test/10.dirb __nn: /tmp/test/30.dird __ll: /tmp/test/30.dird
```

Equivalently, *\_\_first*, *\_\_prev*, *\_\_next* and *\_\_last* are also defined.

Note that all directory orders are based on an alphanumerical sort of directory names. *9.dir* comes after *10.dir*. (so use *09.dir*).

The latter definitions override the earlier ones.

## adhoc - create jobs from adhoc bash code

```
moa.plugin.system.adhoc.createAdhoc (job)
```

Creates an adhoc job.

```
moa.plugin.system.adhoc.createMap (job, args)
```

create an adhoc moa 'map' job

Moa will query the user for process, input & output files. An example session

```
moa.plugin.system.adhoc.createReduce (job)
```

Create a 'reduce' adhoc job.

There are a number of ways this command can be used:

```
$ moa reduce -t 'a title' -- echo 'define a command'
```

Anything after *-* will be the executable command. If omitted, Moa will query the user for a command.

Moa will also query the user for input & output files. An example session:

```
$ moa map -t 'something intelligent'
process:
> echo 'processing {{ input }} {{ output }}'
input:
> ../10.input/*.txt
output:
> ../*.out
```

Assuming you have a number of text files in the *../10/input/* directory, you will see, upon running:

```
processing ../10.input/test.01.txt ../test.01.out
processing ../10.input/test.02.txt ../test.02.out
processing ../10.input/test.03.txt ../test.03.out
...
```

```
moa.plugin.system.adhoc.exclamate (job, args)
```

Create a 'simple' job from the last command issued.

Set the *process* parameter to the last issued command. If a moa job exists in the current directory, then the *process* parameter is set without questions. (even if the Moa job in question does not use the *process* parameter). If no moa job exists, a *simple* job is created first.

*Note:* This works only when using *bash* and if *moainit* is sourced properly. *moainit* defines a bash function *\_moa\_prompt* that is called every time a command is issued (using

`$PROMPT_COMMAND`). The `_moa_prompt` function takes the last command from the bash history and stores it in `~/.config/moa/last.command`. Additionally, the `_moa_prompt` function stores all commands issued in a Moa directory in `.moa/local_bash_history`.

`moa.plugin.system.adhoc.exclamateInJob (job, args, command)`  
Reuse the last issued command: set it as the ‘process’ parameters in the current job

`moa.plugin.system.adhoc.exclamateNoJob (job, args, command)`  
Create a “simple” job & set the last command to the ‘process’ parameter

`moa.plugin.system.adhoc.simple (job, args)`  
Create a ‘simple’ adhoc job.

Simple meaning that no in or output files are tracked. Moa will query you for a command to execute (the *process* parameter).

### configure - Configure jobs

Control job configuration

`moa.plugin.system.configure.hook_git_finish_set ()`  
Execute just after setting a parameter

`moa.plugin.system.configure.set (job, args)`  
Set one or more variables

This command can be used in two ways. In its first form both parameter key and value are defined on the command line: `moa set KEY=VALUE`. Note that the command line will be processed by bash, which can either create complications or prove very useful. Take care to escape variables that you do not want to be expanded and use single quotes where necessary. For example, to include a space in a variable: `moa set KEY='VALUE WITH SPACES'`.

Alternative use of the set command is by just specifying the key: ‘moa set PARAMETER\_NAME’, in which case Moa will prompt the user enter a value - circumventing problems with bash interpretation.

`moa.plugin.system.configure.show (job, args)`  
Show all parameters know to this job.

Parameters in **bold** are specifically configured for this job (as opposed to those parameters that are set to their default value). Parameters in red are not configured, but need to be for the template to operate. Parameters in blue are not configured either, but are optional.

`moa.plugin.system.configure.unset (job, args)`  
Remove a parameter from the configuration

Remove a configured parameter from this job. In the parameter was defined by the job template, it reverts back to the default value. If it was an ad-hoc parameter, it is lost from the configuration.

### doc - Manage job documentation

Manage project / title / description for jobs

`moa.plugin.system.doc.blog (job, args)`  
Add an entry to the blog job (Blog.md)

Allows a user to maintain a blog for this job (in Blog.md). Use as follows:

```
$ moa blog
Enter your blog message (ctrl-d on an empty line to finish)

... enter your message here ..

[ctrl-d]
```

Note: the ctrl-d needs to be given on an empty line. The text is appended to moa.description. In the web interface this is converted to [Markdown](#).

`moa.plugin.system.doc.change(job, args)`  
Add entry to CHANGELOG.md

This function allows the user to add an entry to CHANGELOG.md (including a timestamp). Use it as follows:

```
$ moa change
Enter your changelog message (ctrl-d on an empty line to finish)

... enter your message here ..

[ctrl-d]
```

Note: the ctrl-d needs to be given on an empty line. The text is appended to moa.description. In the web interface this is converted to [Markdown](#).

Note the same can be achieved by specifying the -m parameter (before the command - for example:

*moa -m 'intelligent remark' set ...*

`moa.plugin.system.doc.hook_defineCommands()`  
Set the moa commands for this plugin

`moa.plugin.system.doc.hook_git_finish_blog()`  
Execute just after setting running moa blog

`moa.plugin.system.doc.hook_git_finish_change()`  
Execute just after setting running moa blog

`moa.plugin.system.doc.hook_git_finish_readme()`  
Execute just after setting running moa readme

`moa.plugin.system.doc.readme(job, args)`  
Edit the README.md file for this job

You could, obviously, also edit the file yourself - this is a mere shortcut to try to stimulate you in maintaining one

## extraCommands - Pre & Post commands

Allow execution of a bash oneline before & after job completion

`moa.plugin.system.extraCommands.hook_postRun()`  
If defined, execute the postCommand

`moa.plugin.system.extraCommands.hook_preRun()`  
If defined, execute the precommand

`moa.plugin.system.extraCommands.postcommand (job, args)`  
Execute 'postcommand'

`moa.plugin.system.extraCommands.precommand (job, args)`  
Execute 'precommand'

### fileset - define sets of in&output files

`moa.plugin.system.fileset.files (job, args)`  
Show in and output files for this job

Display a list of all files discovered (for input & prerequisite type filesets) and inferred from these for map type filesets.

### help - generate help

`moa.plugin.system.help.pager (template, templateData)`  
render the template & send it to the pager

`moa.plugin.system.help.templateHelp (job)`

`moa.plugin.system.help.welcome (job)`  
print a welcome message

### info - Job information

Print info on Moa jobs and Moa

`moa.plugin.system.info.err (job, args)`  
Show the stderr of the most recently executed moa job

`moa.plugin.system.info.out (job, args)`  
Show the stdout of the most recently executed moa job

`moa.plugin.system.info.tree (job, args)`  
Show a directory tree and job status

`moa.plugin.system.info.version (job, args)`  
print moa version number

### lock - Lock/Unlock moa jobs

`moa.plugin.system.lock.lock (job, args)`  
Lock a job - prevent execution

`moa.plugin.system.lock.unlock (job, args)`  
Unlock a job - allow execution

### logger - Log Moa activity

`moa.plugin.system.logger.log (job, args)`  
Show activity log

Shows a log of moa commands executed. Only commands with an impact on the pipeline are logged, such as *moa run* & *moa set*.

```
moa.plugin.system.logger.niceRunTime(d)
```

Nice representation of the run time *d* is time duration string

### moautil - Some extra utilities - copy/move jobs

```
moa.plugin.system.moautil.archive(job, args)
```

Archive a job, or tree with jobs for later reuse.

This command stores only those files that are necessary for execution of this job, that is: templates & configuration. In & output files, and any other file are ignored. An exception to this are all files that start with 'moa'. If the *name* is omitted, it is derived from the *jobid* parameter.

It is possible to run this command recursively with the *-r* parameter - in which case all (moa job containing) subdirectories are included in the archive.

```
moa.plugin.system.moautil.cp(job, args)
```

Copy a moa job, or a tree with jobs (with *-r*).

moa cp copies only those files defining a job: the template files and the job configuration. Additionally, all files in the moa directory that start with *moa*. (for example *moa.description* are copied as well. Data and log files are not copied!. If used in conjunction with the *-r* (recursive) flag the complete tree is copied.

```
moa.plugin.system.moautil.mv(job, args)
```

Move, rename or renumber a moa job.

### newjob - Instantiate new jobs

```
moa.plugin.system.newjob.new(job, args)
```

Create a new job.

This command creates a new job with the specified template in the current directory. If the directory already contains a job it needs to be forced using '-f'. It is possible to define arguments for the job on the commandline using KEY=VALUE after the template. Note: do not use spaces around the '=' sign. Use quotes if you need spaces in variables (KEY='two values')

### parameterCheck - check parameters

```
moa.plugin.system.parameterCheck.hook_promptSnippet()
```

Function used by the prompt plugin to generate snippets for inclusion in the prompt

```
moa.plugin.system.parameterCheck.test(job, args)
```

Test the job parameters

### project - Simple plugin to ease maintaining project data

Have more plans for this plugin - but for now it defines the following two variables to use in the job configuration

- *\_p* : directory of the parent project

- project: the ‘title’ variable of the first parent project

### status - Job Status

Possible job states:

- waiting - not yet executed
- running - is currently being executed
- success - finished successfully
- error - finished with an error
- interrupted - manual interruption

`moa.plugin.system.status.kill (job, args)`

Kill a running job.

This command checks if a job is running. If so - it tries to kill it by sending SIGKILL (-9) to the job.

`moa.plugin.system.status.pause (job, args)`

Pause a running job

`moa.plugin.system.status.resume (job, args)`

Resume a running job

`moa.plugin.system.status.status (job, args)`

Show job status

Print a short status of the job, including configuration

### template - information on templates

`moa.plugin.system.template.list (job, args)`

Lists all known templates

Print a list of all templates known to this moa installation. This includes locally installed templates as well.

`moa.plugin.system.template.refresh (job, args)`

Refresh the template

Reload the template from the original repository.

### test - Run unittests

### umaks - Sets umaks for the moa process

### varInject - Inject variables into this job

## 2.9.12 Yaco

Yaco provides a *dict* like structure that can be serialized to & from `yaml`. Yaco objects behave as dictionaries but also allow attribute access (loosely based on this [‘recipe <](#)

<http://code.activestate.com/recipes/473786/>>‘\_). Sublevel dictionaries are automatically converted to Yaco objects, allowing sublevel attribute access, for example:

```
>>> x = Yaco()
>>> x.test = 1
>>> x.sub.test = 2
>>> x.sub.test
2
```

Note that sub-dictionaries do not need to be initialized. This has as a consequence that requesting uninitialized items automatically return an empty Yaco object (inherited from a dictionary).

Yaco can be found in the [Python package index](#) and is also part of the [Moa source distribution](#)

## Autogenerating keys

An important feature (or annoyance) of Yaco is the auto generation of keys that are not present (yet). For example:

```
>>> x = Yaco()
>>> x.a.b.c.d = 1
>>> assert(x.a.b.c.d == 1)
```

works - *a*, *b* and *c* are assumed to be Yaco dictionaries and *d* is give value *1*. This makes populating data structures easy.

It might also generate some confusion when querying for keys in the Yaco structure - if a key does not exists, it automatically comes back as an empty *dict* or Yaco object (renders as *{}*). This means that if it is easy to check if a certain ‘branch’ of a Yaco datastructure exists:

```
>>> x = Yaco()
>>> assert(not x.a.b)
```

but now the following works as well:

```
>>> assert(x.has_key('a'))
>>> assert(x.a.has_key('b'))
```

So, a safe way to test a data structure, without introducing extra branches is:

```
>>> x = Yaco()
>>> assert(not x.has_key('a'))
```

Todo: Need to find a more elegant way of testing without introducing data structures

**class** Yaco.Yaco(*data={}*)

Rather loosely based on <http://code.activestate.com/recipes/473786/> (r1)

```
>>> v= Yaco()
>>> v.a = 1
>>> assert(v.a == 1)
>>> assert(v['a'] == 1)
>>> v= Yaco({'a':1})
>>> assert(v.a == 1)
>>> assert(v['a'] == 1)
```

**get\_data()**

Prepare & parse data for export

```
>>> y = Yaco()
>>> y.a = 1
>>> y.b = 2
>>> y._c = 3
>>> assert(y._c == 3)
>>> d = y.get_data()
>>> assert(d.has_key('a') == True)
>>> assert(d.has_key('b') == True)
>>> assert(d.has_key('_c') == False)
>>> y._private = ['b']
>>> d = y.get_data()
>>> assert(d.has_key('a') == True)
>>> assert(d.has_key('b') == False)
>>> assert(d.has_key('_c') == False)
```

**load** (*from\_file*)

Load this dict from\_file

```
>>> import yaml
>>> import tempfile
>>> tf = tempfile.NamedTemporaryFile(delete=False)
>>> tf.write(yaml.dump({'a' : [1,2,3, [1,2,3, {'d' : 4}]], 'b': 4, 'c': '5'}))
>>> tf.close()
>>> y = Yaco()
>>> y.load(tf.name)
>>> assert(y.a[3][3].d == 4)
```

**pretty** ()

Return data as a pprint.pformatted string

**save** (*to\_file*, *doNotSave*=[ ])**simple** ()

return a simplified representation of this Yaco struct - remove Yaco from the equation - and all object reference. Leave only bool, float, str, lists, tuples and dicts

```
>>> x = Yaco()
>>> x.y.z = 1
>>> assert(isinstance(x.y, Yaco))
>>> s = x.simple()
>>> assert(s['y']['z'] == 1)
>>> assert(isinstance(s['y'], dict))
>>> assert(not isinstance(s['y'], Yaco))
```

**update** (*data*)

```
>>> v = Yaco({'a' : [1,2,3,{'b' : 12}]})
>>> assert(v.a[3].b == 12)

>>> v = Yaco({'a' : [1,2,3,[1,{'b' : 12}]]})
>>> assert(v.a[3][1].b == 12)
```

## 2.9.13 fist

### Filesets

## Handle & manipulate sets of files

This module aims at providing classes to handle and manipulate sets of files. Two simple examples are a simple set containing one file (`fist.fistSingle`) or a *glob* based set of files (`fist.fistFileset`). A more complicated example is `fistMapset` that maps another fileset based on a pattern.

Each fileset inherits from *list* - hence fist filesets behave as lists.

Future work should allow the definition of remote filesets (for example over http or ssh).

Each fist class is instantiated with a url defining the file(set). In the case of `fist.fistFileset` this url contains a globbing characters:

```
fs = fist.fistFileset('/tmp/*.txt')
```

This fileset object contains a list with all *\*.txt* files in */tmp*. Subsequently it is possible to map this set

```
class fist.fistCore(url, context=None)
```

Core class for all fist classes

```
    resolve()
```

This function needs to be overridden context

```
class fist.fistFileset(url, context=None)
```

Most basic set of files - handle a set of files described by a single URI with wildcards, for example:

```
* '*.txt'
* '../*.txt'
* 'file:///home/name/data/*.txt'
```

```
>>> f = fistFileset('*.txt')
>>> assert(f.path=='.')
>>> assert(f.glob=='*.txt')
>>> assert(f.path=='.')
>>> assert(f.glob=='*.txt')
>>> f = fistFileset('/tmp')
>>> assert(f.path=='/tmp')
>>> assert(f.glob=='*')
>>> f = fistFileset('/tmp/*.txt')
>>> assert(f.path=='/tmp')
>>> assert(f.glob=='*.txt')
>>> f = fistFileset('../*.txt')
>>> assert(f.path=='..')
>>> assert(f.glob=='*.txt')
>>> f = fistFileset(os.path.join(wd, 'in', '*.txt'))
>>> f.resolve()
>>> assert(len(f) == 100)
>>> f = fistFileset(os.path.join(wd, 'in', 'in1*.txt'))
>>> f.resolve()
>>> assert(len(f) == 10)
>>> f = fistFileset('~/*')
>>> f.resolve()
>>> assert(len(f) > 0)
```

```
class fist.fistMapset(url, context=None)
```

fistMapset

Map set - map a fileset based on a target uri

```
>>> f = fistFileset(os.path.join(wd, 'in', '*'))
>>> f.resolve()
>>> assert(len(f) == 100)
>>> ##
>>> ## Null mapping
>>> ##
>>> m = fistMapset('*/*')
>>> m.resolve(f)
>>> assert(len(m) == 100)
>>> assert(os.path.join(wd, 'in/in18.txt') in m)
>>> ##
>>> ## simple folder mapping
>>> ##
>>> m = fistMapset('out/*')
>>> m.resolve(f)
>>> assert(len(m) == 100)
>>> assert('out/in18.txt' in m)
>>> ##
>>> ## simple folder mapping
>>> ##
>>> m = fistMapset('./*')
>>> m.resolve(f)
>>> assert(len(m) == 100)
>>> assert('./in18.txt' in m)
>>> ##
>>> ## simple folder & mapping & extension append
>>> ##
>>> m = fistMapset('out/*.out')
>>> m.resolve(f)
>>> assert(len(m) == 100)
>>> assert('out/in18.txt.out' in m)
>>> ##
>>> ## New from fileset - now with a pattern defining the extension
>>> ##
>>> f = fistFileset(os.path.join(wd, 'in', '*.txt'))
>>> f.resolve()
>>> ##
>>> ## extension mapping
>>> ##
>>> m = fistMapset('out/*.out')
>>> m.resolve(f)
>>> assert(len(m) == 100)
>>> assert('out/in18.out' in m)
>>> ##
>>> ## New from fileset - now with a pattern defining file glob &
>>> ## extension
>>> ##
>>> f = fistFileset(os.path.join(wd, 'in', 'in*.txt'))
>>> f.resolve()
>>> ##
>>> ## more complex filename mapping
>>> ##
>>> m = fistMapset('out/test*.out')
>>> m.resolve(f)
>>> assert(len(m) == 100)
>>> assert('out/test18.out' in m)
>>> ##
```

```
>>> ## mapping keeping the extension the same
>>> ##
>>> m = fistMapset('out/test*.txt')
>>> m.resolve(f)
>>> assert(len(m) == 100)
>>> assert('out/test18.txt' in m)
```

**resolve** (*mapFrom*)

Resolve the mapped set based on a input fileSet

**resolver** (*mapFrom*, *list*)

map all files in the incoming list

**class** `fist.fistSingle` (*url*, *context=None*)

Represents a single file

**init** ()

Assuming the url is a single file
